PRECISION ACTUATION

SCREW JACK DESIGN GUIDE

POWERJACKS

Best engineered
solution for precision
linear actuation,
power transmission
& jacking systems.

Capability

OUR EXPERTISE HAS BEEN BUILT ON A HISTORY OF MORE THAN 100 YEARS OF ENGINEERING, CRAFTSMANSHIP, VISIONARY DESIGN, QUALITY MANUFACTURE AND CUSTOMER CARE.

Power Jacks is a manufacturing/engineering company specialising in the design and manufacture of actuation, lifting and positioning solutions for applications in Industrial Automation, Energy, Defence, Medical, Transport, and the Civil Engineering sectors.

Headquartered near Aberdeen in the UK, the company is the UK's largest screw jack manufacturing facility, that uses the latest engineering technologies to deliver quality products (BS EN ISO 9001) that offer reliability, performance and economy.

Power Jacks deliver this high quality service in a safe (OHSAS 18001) and environmentally friendly (ISO 14001) working environment thanks to the highly trained, flexible and motivated teams that work throughout the business driving the company to higher levels of performance.

We know our customers demand our engineering expertise to help find a solution for their applications. We take pride in designing and delivering the best solution using standard or special designs that help improve your business.

Our Vision is to become the partner of choice for our products globally

Our Mission is to provide high quality lifting & positioning solutions.

Global Reach

Power Jacks has local representation in 26 countries and supplies its products to more than 80 countries worldwide.

A global reach with a local service as we work closely with our customers to ensure the best solution for all their Electro-Mechanical solution applications.

NEED HELP SELECTING A GEARBOX? THEN TRY OUR PRODUCT SELECTOR

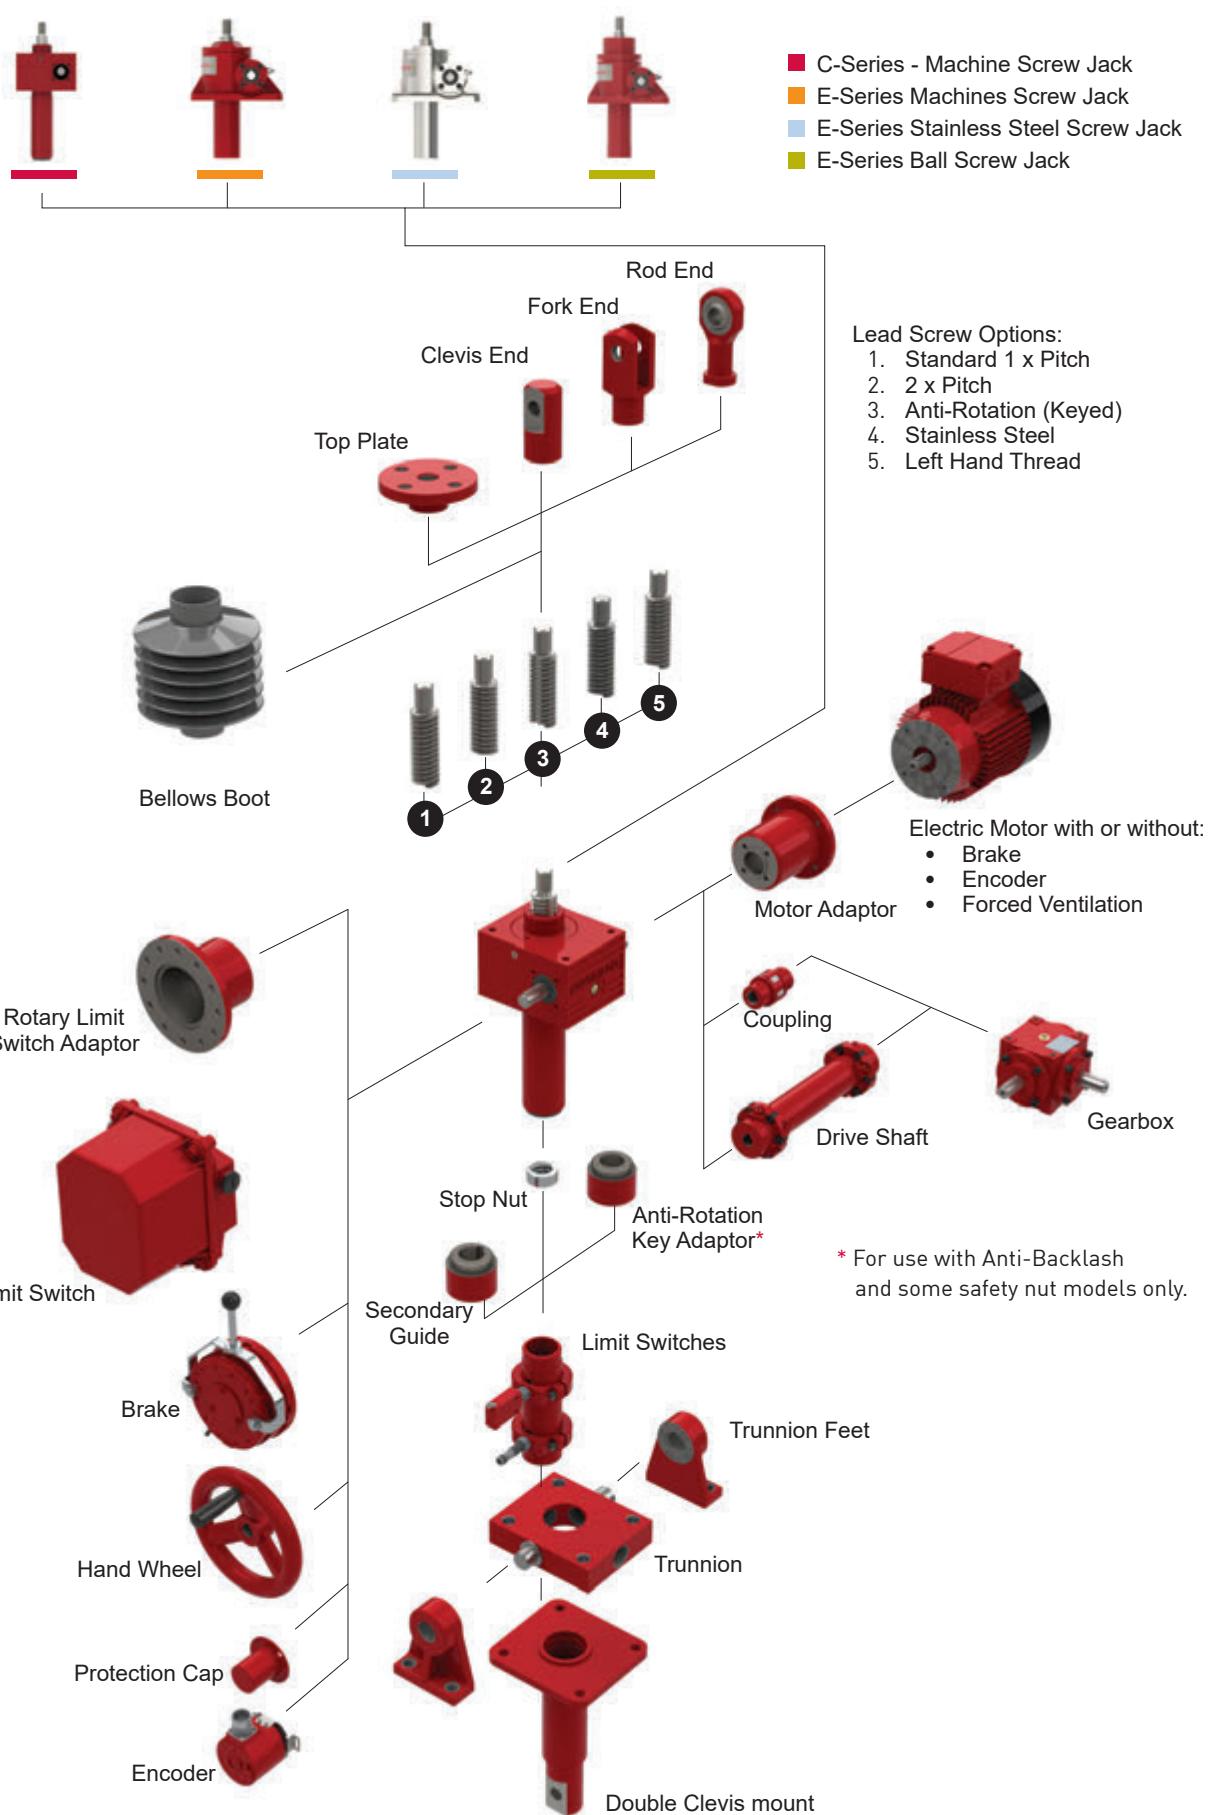

Just enter your application details and the Product Selector will recommend a suitable product with a calculation summary and links to the associated CAD and Data Sheets. An ideal tool if you are not familiar with the products or need answers fast.

The screenshot illustrates the user interface of the Engineering: Product Selector. It begins with a search bar at the top containing the text 'Gearbox'. Below the search bar, there is a section titled 'Enter details below to find a product that meets your requirements.' This section includes input fields for 'Gear Ratio' (set to 1.0), 'Input Power' (set to 0.171), and 'Shaft Type' (set to 'Solid'). A red callout box with the text 'Enter Application Data' points to these input fields. To the right, a large red arrow points from the search results towards the recommended product details. The search results page shows a product card for a 'NEMA34 Gearbox'. The card displays the part number 'Part Number: NEMA34-08400-0000-0000-0000', a 3D model of the gearbox, and various configuration options like 'Shaft Type' (set to 'Solid'), 'Shaft Configuration' (set to '3-Way'), and 'Mounting Options' (set to 'Helmholtz'). A second red callout box on the right side of the results page contains the text 'Get Recommended Product with • CAD • Data Sheets'.

C-Series - Rotating Screw

■ Special Screw Jacks Design Available when you need more than the standard solution.

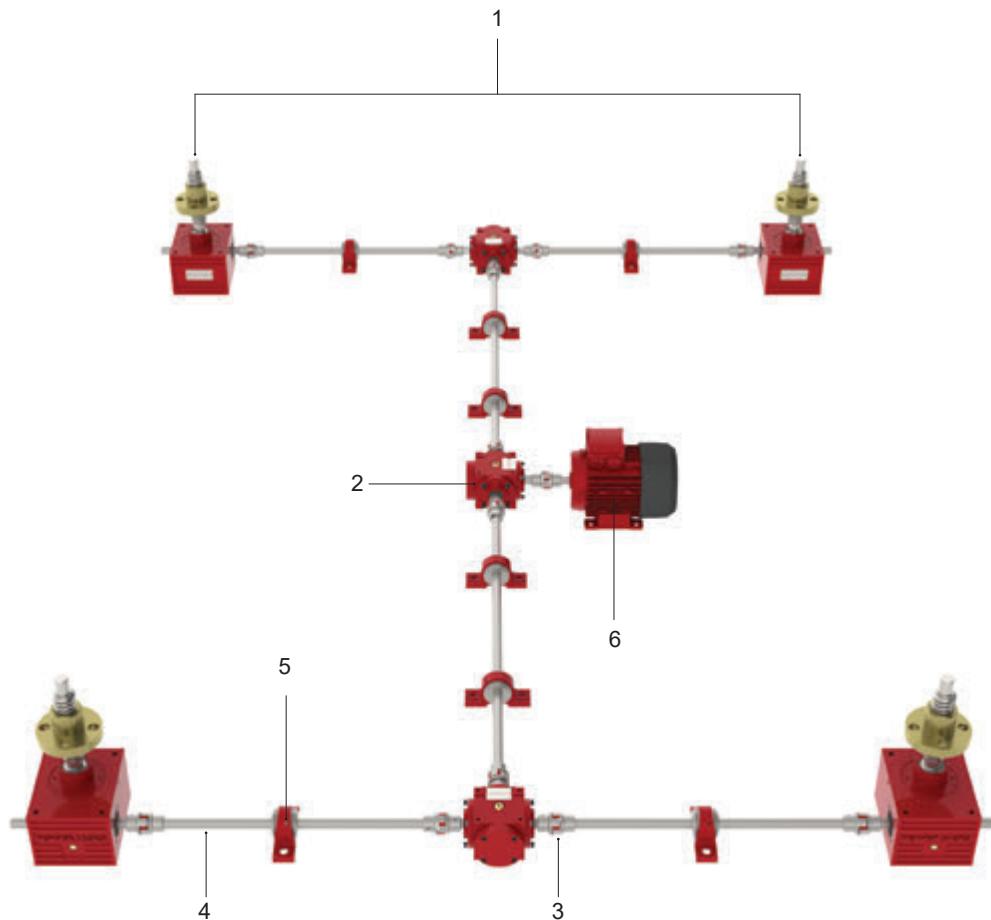

■ Special Screw Jacks Design Available when you need more than the standard solution.

Screw jacks can be connected together in systems so that multiple units can be operated and controlled together. These jacking system arrangements or configurations can be built in many formats with the use of bevel gearboxes, motors, reduction gearboxes, drive shafts, couplings, plummer blocks and motion control devices.

Four of the most popular system configurations are the 'H', 'U', 'T' and 'I' configured jacking systems. Note that multiple screw jacks can be linked together mechanically or electrically. The latter is useful if there is no space for linking drive shafts.

Typical 'H' configuration System

1. Screw Jack
C-Series Rotating Machine Screw Jack shown here.
2. Bevel Gearbox
Range-N Spiral Bevel Gearboxes
3. Flexible Coupling
A range of couplings are available to suit each systems requirements including Jaw, Spacer and Geared types.
4. Drive Shaft
Every drive shaft is manufactured to order for each system design. Self supporting drive shafts (spacer couplings) are also available.
5. Shaft Supports (plummer blocks).
6. Electric Motor
Standard electric motors in 3 phase, 1 phase, DC and servo designs. Supplied as a basic motor or as part of a geared motor. Brakes are available for all motors.

Jacking systems are not limited to the number of screw jacks shown here. They are regularly supplied to clients with 2, 4, 6, 8 jack systems. Larger systems can extend up to 16 or higher. With the use of electronic synchronisation/control multiple systems or screw jacks can be used in unison. Extending the possible number of screw jacks used in unison in excess of 100.

To facilitate electronic control of screw jacks, feedback devices (eg encoder, limit switch) are available, mounted on the screw jack or its motor or another system component.

Notes:

- #1 Rotating screw models only.
- #2 Trunnions on same side as worm shaft (standard).
- #3 Trunnions at 90° to worm shaft.
- #4 Standard right hand thread form. Worm shaft turns clockwise to extend screw.
- #5 Left hand thread form. Worm shaft turns anti-clockwise to extend screw.
- #6 Standard is clevis axis parallel to worm shaft.
- #7 Limit switch mounting included.
- #8 Plain End "A" has same dimensions as "E - threaded end" except no thread form.
- #9 Translating screw models only.
- #10 Basic Translating and Rotating units in both Upright and Rotating versions (all variant & accessories on application).
- #11 All models except E-Series 5 kN & 10 kN models
- #12 Models 10 - 100kN only
- #13 Power Jacks defined standard paint - available as a data sheet.
- #14 Power Jacks defined standard lubricant.
- #15 For Rotating Screw Jacks the "Cover Pipe" may actually be a "Plug"
- #16 All Stainless Steel Screw Jack by default defines the worm shaft, lifting screw and end fitting as Power Jacks standard stainless steel material.
- #17 If Lifting Screw is Stainless Steel material then the End Fitting is Stainless Steel as well by default.
- #18 Limit Switches not included. Limit switch specification to be detailed as separate item.

Five Step Guide to Initial Screw Jack Selection

The following selection procedure is applicable for Machine Screw and Ball Screw Jacks.

Calculate Power and Torque Requirements

Select a screw jack from the tables with adequate load carrying capacity and note the screw jack static and dynamic efficiency for required input speed.

Step 1 - Screw Jack Input Speed

$$N \text{ (rpm)} = \frac{\text{Linear Speed (mm/min)} \times \text{Gear Ratio}}{\text{Pitch (mm)} \times N^{\circ} \text{ of Starts on Lifting Screw}}$$

Input speed should not exceed 1800 rpm.
Number of starts on lifting screw is usually 1,
unless otherwise stated.

Note: Screw Lead = Pitch x No of Starts

Step 2 - Operating Input Power (kW), P_{in}

$$P_{in} \text{ (kW)} = \frac{\text{Load (kN)} \times \text{Linear Speed (mm/min)}}{60000 \times \eta_d}$$

η_d = Dynamic Screw Jack Efficiency

Step 3 - Operating Input Torque

$$T_{ino} \text{ (Nm)} = \frac{P_{in} \text{ (kW)} \times 9550}{N \text{ (rpm)}}$$

Step 4 - Screw Jack Start-Up Torque

$$T_{ins} = \frac{\text{Load (kN)} \times \text{Pitch (mm)} \times N^{\circ} \text{ of Starts on Lifting Screw}}{2 \times \pi \times \eta_s \times \text{Gear Ratio}}$$

η_s = Static Screw Jack Efficiency

Note: Screw Lead = Pitch x No of Starts

Step 5 - Mechanical Power and Torque Check

Check whether the screw jack power and torque required for the application is not greater than the maximum allowable mechanical input power ($P_{mechanical}$) and Start-Up Torque at Full Load (T_s) values specified in the screw jack performance tables.

If $P_{mechanical} > P_{in}$ & $T_s > T_{ins}$ then the screw jack selected is acceptable for power requirements.

Example Selection

Application Constraints

- Load on Screw Jack = 15 kN in Tension
- Linear Speed required = 100 mm/min

Consider all application constraints then choose a screw jack that looks suitable for the application with a load rating equal to or greater than the maximum working load. For this example, a 25 kN E-Series Machine Screw Jack [refer P60] with translating screw, 6:1 gear ratio, single start lifting screw (6 mm lead).

Calculate Power and Torque Requirements

Step 1 - Screw Jack Input Speed

$$N \text{ (rpm)} = \frac{100 \text{ (mm/min)} \times 6 \text{ (Gear Ratio)}}{6 \text{ (mm)} \times 1 \text{ (N}^{\circ} \text{ of starts on Lifting Screw)}}$$

$N = 100 \text{ rpm}$
Input speed should not exceed 1800 rpm.

Step 2 - Operating Input Power (kW), P_{in}

$$P_{in} \text{ (kW)} = \frac{15 \text{ (kN)} \times 100 \text{ (mm/min)}}{60000 \times 0.264}$$

$\eta_d = 0.264$ (Refer P60)
 $P_{in} = 0.095 \text{ kW}$

Step 3 - Operating Input Torque

$$T_{ino} \text{ (Nm)} = \frac{0.095 \text{ (kW)} \times 9550}{100 \text{ (rpm)}}$$

$T_{ino} = 9.1 \text{ Nm}$

Step 4 - Screw Jack Start-Up Torque

$$T_{ins} = \frac{15 \text{ (kN)} \times 6 \text{ (mm)} \times 1 \text{ (N}^{\circ} \text{ of starts on Lifting Screw)}}{2 \times \pi \times 0.201 \times 6 \text{ (Gear Ratio)}}$$

$T_{ins} = 11.9 \text{ Nm}$
 $\eta_s = 0.201$ (refer P60)

Step 5 - Mechanical Power and Torque Check

Find the screw jacks mechanical power and torque rating from the performance data tables (refer P60).

$$P_{mechanical} = 1.5 \text{ kW} > P_{in} \text{ and } T_s = 19 \text{ Nm} > T_{ins}$$

Therefore the screw jack selected is suitable for application for initial constraints tested, further analysis may be required to ensure the screw jack is suitable for all application conditions. Continue with further selection calculations or consult Power Jacks Ltd.

Screw Jack Constraints for Detailed Selection

Lifting Screw Column Strength

For compressive loads on the screw jack lifting screw column strength calculations are required to check for buckling. As a screw jack selection guide use the following process:

1. Determine the maximum column strength (L) for the screw jack being considered.
2. Referring to the relevant column buckling chart determine the permissible compressive load (W_p) corresponding to the column length (L) for the appropriate end constraints. This permissible compressive load is the maximum load (inclusive of shock loads) which may be applied to the screw jack for a given column length.
3. Where an application involves human cargo or there is a risk to personnel, it is highly recommended that the permissible compressive load (as calculated above) be factored by 0.7 to enhance working safety. (Equivalent to a column strength safety factor of 5).

$$W_{phc} = W_p \times 0.7 \quad (\text{Permissible compressive load for personnel risk applications})$$

Note 1. For detailed analysis of screw jacks and their systems consult Power Jacks.

2. Safety factor of 3.5 for column strength's used for normal industrial cargo.

Lifting Screw Critical Speed

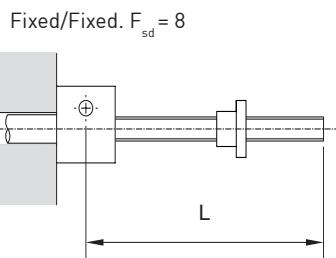

For fast operating rotating screw jacks, the critical speed (rotational speed) of the lifting screw needs to be considered in case of shaft whirling. To calculate the critical speed for rotating screw jacks:

1. Refer to the appropriate critical speed chart.
2. Select the correction factor F_{cs} corresponding to the end support conditions for the application.
3. From the critical speed chart, select the critical speed corresponding to the unsupported screw length (m) and the screw jack load rating (kN).
4. Calculate the limiting critical speed with the formula: **Limiting Critical Speed = Critical screw speed $\times F_{cs}$**

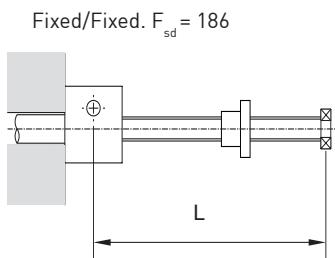

Lifting Screw Deflection

The lifting screw of a screw jack mounted horizontally will deflect under its own weight to some extent. The amount of deflection tolerable (y_T) should be less than 0.5 mm per metre.

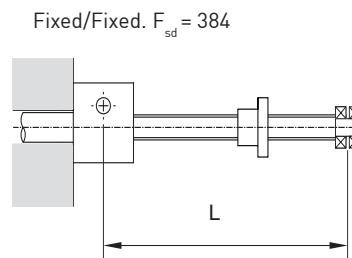

Deflection Factors, F_{sd}

$$\text{Deflection, } y, (\text{mm}) = \frac{6 \times 10^{-9} \times L^4}{F_{sd} (d-p)^2}$$

$$\text{Deflection Tolerable, } y_T, (\text{mm}) = \frac{0.5 \times L}{1000}$$

L = Lifting Screw Length (mm)
 d = Diameter of Lifting Screw (mm)
 p = Pitch of Lifting Screw (mm)

If $y < y_T$ then the lifting screw deflection is acceptable.

Note: This is only a deflection guide. For detailed analysis, including methods to reduce deflections, consult Power Jacks Ltd.

Screw Jack Input Torque

Start up/static torque values are listed in all performance tables. Whereas dynamic torque values are either calculated using the tabulated dynamic efficiencies or taken direct from torque tables where listed. For detailed screw jack analysis consult Power Jacks Ltd.

Side Loads on Screw Jacks

It is recommended that all side loads (F_{sl}) are carried by guides in your arrangement and not by the lifting screw and nut. If there are any side loads on the screw jack, they must not exceed those tabulated in the Engineering Guide, Side Load Rating Section, and it must be noted that any such loads will adversely affect the life of the lifting screw and nut.

Radial Forces on Screw Jack Worm Shaft

For applications where a screw jack is belt driven, radial force (F_R) values exerted on the worm shaft must not exceed those tabulated in the Engineering Guide Section. Values are tabulated for the metric machine screw jacks and ball screw jacks. The values are maximum values for the screw jacks at rated load regardless of worm speed or load direction.

Screw Jack Self-Locking

Approximately 50% of machine screw jacks are self-locking either in the gearbox or the lifting screw, however to ensure there is no self-lowering and to reduce drift due to the motor slowing, a brake is recommended. Standard motor frame size brakes will be suitable for most applications with only slight vibration and thermal fluctuation present. Motor selection as normal.

For dynamic braking consult Power Jacks.

Ball screw jacks and roller screw jacks always require a brake as their high efficiency makes them self-lowering.

Use the closest standard brake size that is greater or equal to the motor brake torque required.

- Note**
1. Self lowering can occur in any jacking system not fitted with a brake, where high levels of vibration are present in the application.
 2. Power Jacks recommend the use of a brake on single screw jack applications in the vertical position.

Jacking System Power Input

Total Input Power for Jacking Systems (kW), P_s :

$$P_s = \frac{\text{Input Power per Screw Jack (kW)} \times \text{Number of Screw jacks}}{\text{Arrangement Efficiency} \times \text{Gearbox Efficiency}}$$

Number of Screw Jacks in System	2	3	4	6-8
Jacking System Efficiency	0.95	0.90	0.85	0.80

Gearbox Efficiency = Bevel Gearbox Efficiency x Reduction Gearbox Efficiency

Bevel Gearbox Efficiency = 0.95 typical

Reduction Gearbox Efficiency = Consult unit details, if no reduction gearbox present assume efficiency of 1.

Note

For Screw Jacks connected in-line, the worm shaft can transmit up to 3 times the torque for a single screw jack at its maximum capacity, except the E--0200 (200kN) Unit which can transmit 1.5 times the torque.

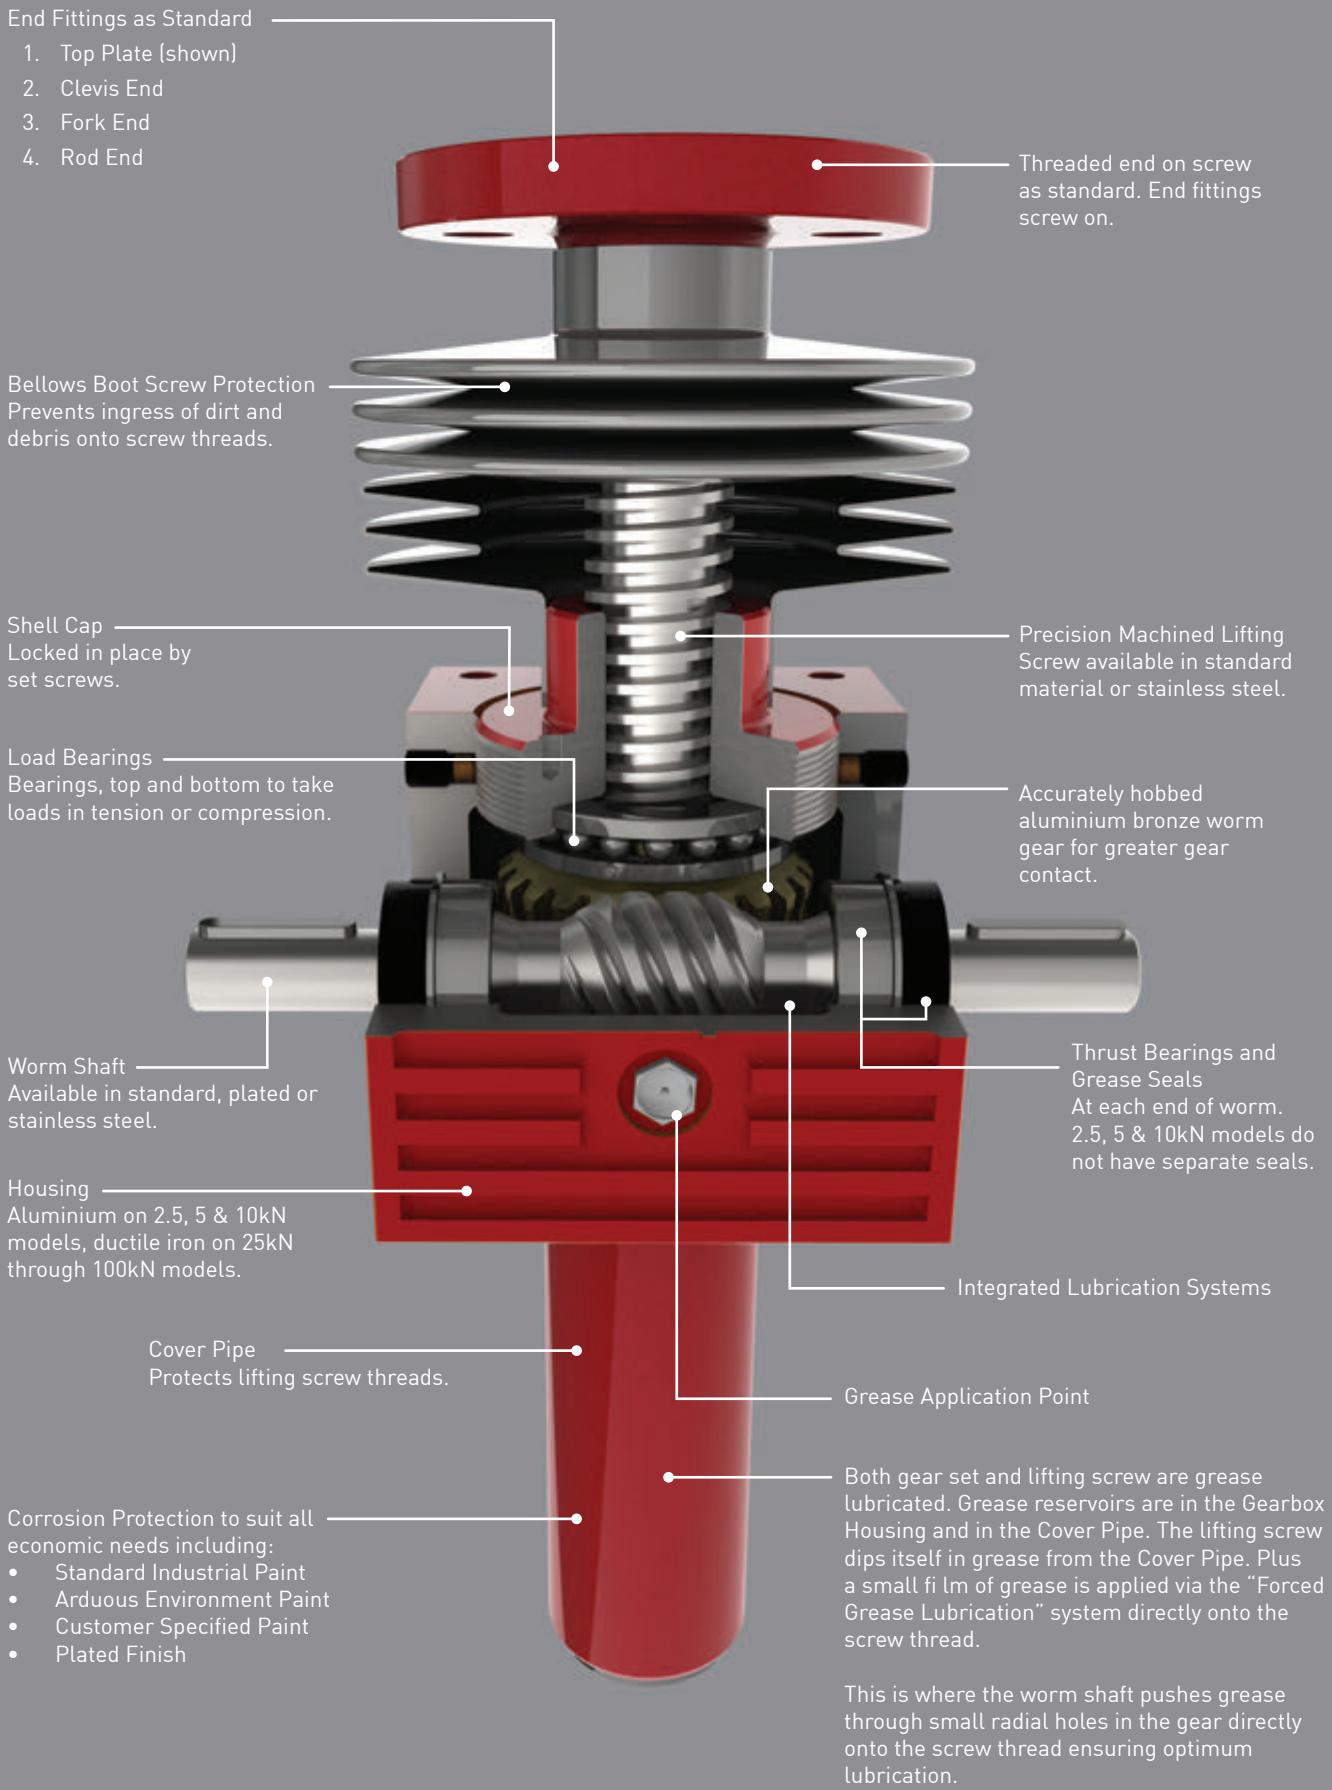

C-Series - Machine Screw Jack

MODULAR CONTEMPORARY
CUBIC DESIGN WITH BOLT-
ON ACCESSORIES TO TAILOR
SCREW JACK FOR YOUR
EXACT APPLICATION NEEDS.

TRANSLATING SCREW JACKS**Key Features**

- Metric Cubic Machine Screw Jacks
- Capacities - 2.5kN to 100kN as standard
- Translating and Rotating Screw
- Precision Worm Gear Set
- Standard Performance Power Jack
- 2 Gear ratios and 2 screw lead as standard
- Anti-backlash and anti-rotation (keyed) options
- 6 mounting options including trunnion and double clevis
- Special custom designs available

ROTATING SCREW JACKS

Translating Screw

Rotating Screw

Typical Applications

Conventional Machine Screw Jacks are most widely used for intermittent duty cycles, as the screw jack incorporates a precision worm gear set in a rugged casting delivering positive, precise actuation. Available in a comprehensive range of materials and fittings with the option for special designs for specific application requirements. Used in a wide variety of industry sectors including metal processing, automotive, energy, civil and aerospace.

Standard Designs

The standard C-Series screw jack is available in translating and rotating screw designs in capacity sizes from 2.5kN to 100kN. Its design is compact and versatile with a large selection of standard options and accessories so you can configure a standard design that is just right for your application. These variants include Anti-Backlash, Anti-Rotation (Keyed) and Safety Nut designs.

Special Designs

We can fully customise our screw jacks so that your application can be the best.

Customisation can be anything from a small modification such as an extra bolt hole on an end fitting to a completely new design of screw jack based on our class leading technology.

For more details please see the Special Screw Jack information in Section-8 or contact us today with your requirements. Our team are looking forward to working with you.

Selecting the Right Screw Jack

Consider all application constraints then choose a product that looks suitable for the intended application. Calculate the power and torque requirements. This is a 5 step process:

- Screw Jack Input Speed (RPM)
- Operating Input Power (kW)
- Operating Input Torque (Nm)
- Screw Jack Start-up Torque (Nm)
- Mechanical Power and Torque Check

Systems

The screw jacks can be connected together in systems so that multiple units can be operated and controlled together. These jacking system arrangements or configurations can be built in many formats with the use of bevel gearboxes, motors, reduction gearbox, drive shafts, couplings, plummer blocks and motion control devices.

The use of bevel gearboxes allows the distribution of drive throughout a jacking system. The gearboxes come in 2,3 and 4 way drive types. See Bevel Gearbox Section-10 for more details.

Bevel gearboxes and other system components can also be supplied in stainless steel or other corrosion resistant designs.

Two of the most popular system configurations are the 'H' and 'U' configured jacking systems. Remember that multiple screw jacks can be linked together mechanically or electrically. The latter is useful if there is no space for linking drive shafts.

If multiple machine screw jacks are connected in a mechanically linked system then the complete system may be considered self-locking. If you would like this checked consult Power Jacks. Alternatively, to be sure, include a brake on the system either as a stand alone device or as a brake motor.

SPECIAL EFFECT CAR REVEAL SYSTEM

C-Series Screw Jack System was pivotal to a dramatic 'magic mirror' effect that slowly unveiled the car to impressed onlookers during the UK launch.

The car sat inside a ring of pillars of coloured LED light, and was covered by a mirrored box that had a horizontal split. To make the car appear and disappear, the sides of the mirrored box were moved up and down in synchronisation so the top and bottom halves of the car were revealed at the same time. To keep the mirror operation simple yet effective, a four screw jack system in an H-configuration using 50kN C-Series rotating machine screw jacks was used. To move the mirrors in different directions at the same time using 1 lifting screw per screw jack required a customised design.

A special lifting screw which had right hand and left hand threads on the same screw was built into each of the screw jacks. The screw length matched the height of the installation: the upper half had a right hand thread form and the lower half had a left hand thread form.

A lifting nut with corresponding thread ran on each thread form portion of the screw, so each screw had two lifting nuts. In total the system had eight lifting nuts (two per screw jack) – four connected to the top mirror section and four to the bottom mirror section. As the jacking system was operated, the nuts ran in opposing directions so the mirror sections did likewise at the same speed in a mechanically synchronised manner.

By using a mechanically linked system, the whole operation was controlled by one motor which greatly simplified the control system and minimised costs.

The four C-Series cubic machine screw jacks selected for the system were mechanically linked to the electric motor via three bevel gearboxes from the ultra compact Range-N design.

For more application examples see the 'Power at Work' brochure or www.powerjacks.com.

Notes:

- All metric machine screws have a trapezoidal thread form.
- For loads of 25% to 100% of screw jack capacity, torque requirements are approximately proportional to the load.
- Efficiency values for standard grease lubricated worm gear box and lifting screw.
- All C-Series screw jacks have grease lubricated gearbox and lead screw as standard.
- Torque required to prevent the lead screw or lead nut from rotating if no anti-rotation device fitted.
- Radial force applied midway along worm shaft key at 90° to key.
- Maximum transmittable torque through worm shaft, not through gear set.

Accessories & Options

Minimise Axial Backlash When Load Changes Direction

The Anti-Backlash feature provides a reliable method to regulate the axial backlash in a screw jack for applications where there is a reversal of loading from tension to compression. The amount of backlash between the screw and worm gear nut can be adjusted (adjust shell cap) to a desired amount or a practical minimum. To avoid binding and excessive wear do not adjust backlash to less than 0.025mm.

The Anti-Backlash feature also acts as a safety device, providing dual nut load carrying unit, when the worm gear becomes worn.

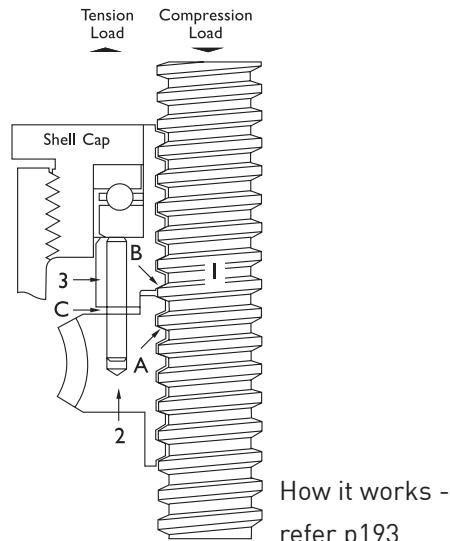

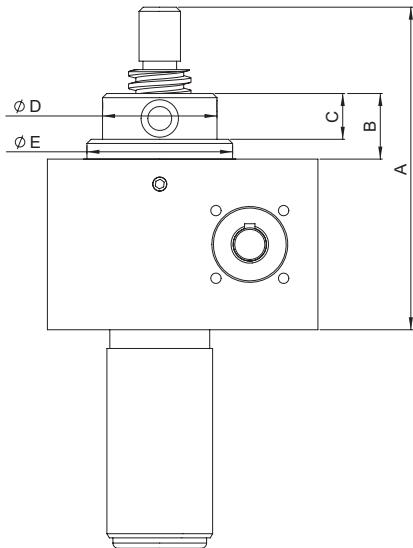

A visual wear indicator is included as standard on all models and a "feeler" gauge can be used to measure the wear. This can be upgraded to use a sensor on request (consult Power Jacks).

Dimensions for Anti-Backlash

The dimensions for these screw jacks are the same as the standard units except those detailed below.

Model	CMT0002-C0A	CMT0005-C0A	CMT0010-C0A	CMT0025-C0A	CMT0050-C0A	CMT0100-C0A

Weight (kg) – stroke = 150mm						

Note: Efficiency values for standard grease lubricated worm gear box and lifting screw.

Note: Efficiency values for standard grease lubricated worm gear box and lifting screw. Weight is the same as standard unit.

Linear Movement for Rotationally Unconstrained Loads

The Anti-Rotation feature for translating screw jacks stops the lead screw from rotating without the need for end fixing. This is done by keying the lifting screw.

Benefits:

- Dimensions are the same as the standard translating screw jack
- Compact unit integrates anti-rotation into gearbox
- Standard round cover pipe for easy installation
- Proven industrial anti-rotation design

Note: Efficiency values for standard grease lubricated worm gear box and lifting screw.

Anti-Rotation with Safety Nut performance is the same as the Anti-Rotaton unit.

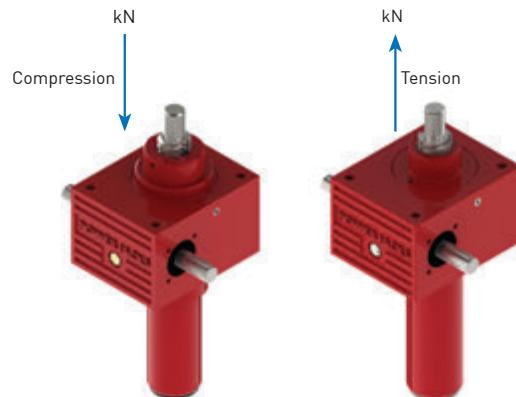

Extra Safety for Critical Applications

Power Jacks machine screw jacks can be fitted with a safety nut, which provides 2 safety roles:

1. In the event of excessive wear on the nut thread the load will be transferred from the standard nut to the safety nut. This will also provide visual wear indication as the gap between the safety nut decreases to zero as the standard lifting nut wears.
 2. In the unlikely event of nut thread failure the safety nut will sustain the load. The safety of industrial and human cargo is therefore improved.
- There are several configurations for each safety nut device as they only work in one load direction. For this reason when ordering please supply a sketch of your application showing load directions.

All Safety Nuts are BS EN 1570 Compliant

Translating Screw Jack with Safety Nut

The dimensions for these screw jacks are the same as the standard units except those detailed below.

Trunnion mounts provide a pivot point at the gearbox of the screw jack.

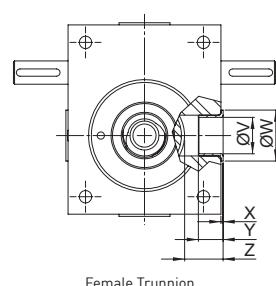

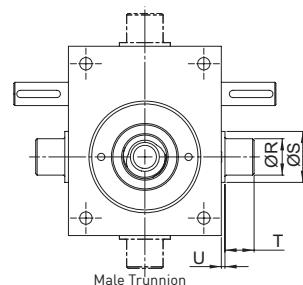

- 2 Pivot Plane Options
- Supplied with or without Trunnion Feet
- Option of Male or Female Trunnions
- Trunnion mounts can be mounted on either side of the screw jacks gearbox

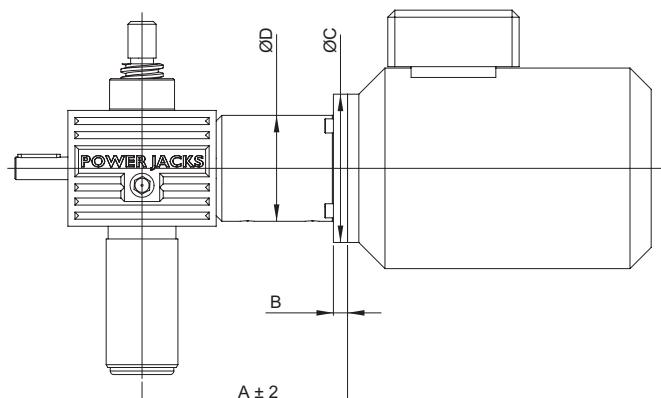

When the trunnions are on the same side as the worm shaft multiple screw jacks can be linked in line with a drive shaft and pivot around a common axis.

The trunnion mounts are connected to the screw jacks gearbox with 4 bolts.

132 B14 C200	239.5	12	200	100	28/38 A25 B38	S

Note:

1. NEMA Motor adaptors available on request
2. Motor adaptors are for the support of motor weight only
3. OR = On Request
4. S = Standard

Limit switches can be mounted on the screw jacks cover pipe to signal stroke positions such as end of travel. The switch is triggered by a cam or target disc on the end of the lifting screw.

Features:

1. Inductive Proximity Sensors as standard. Others including electro-mechanical and safety rated available on request.
2. No contact, so no wearing parts.
3. 2 Wire sensor 24VDC for either Normally Closed (NC) or Normally Open (NO) switching.
4. Sensor has rugged one-piece Metal housing.
5. Optical setting aid
6. M12 Plug in connection for fast change-ability.
7. Sensor kit includes—sensor, mounting ring, target ring and modification to screw jack cover pipe.
8. Switch can have a fixed or adjustable mounting.
9. More sensor details in System Components section of Design Guide.

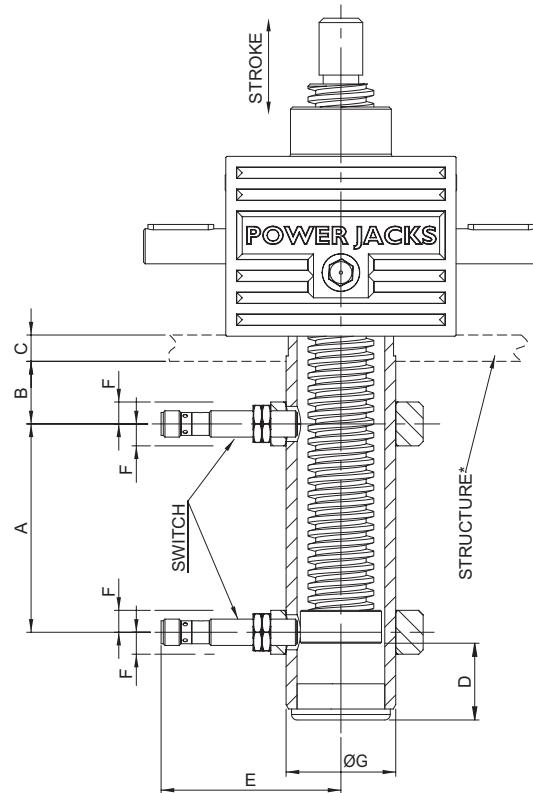

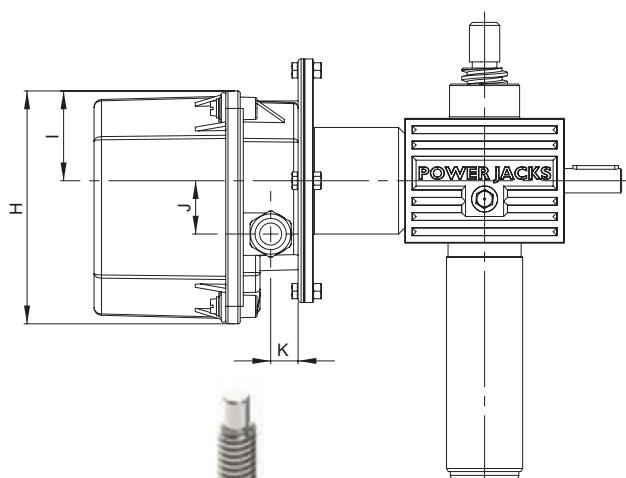

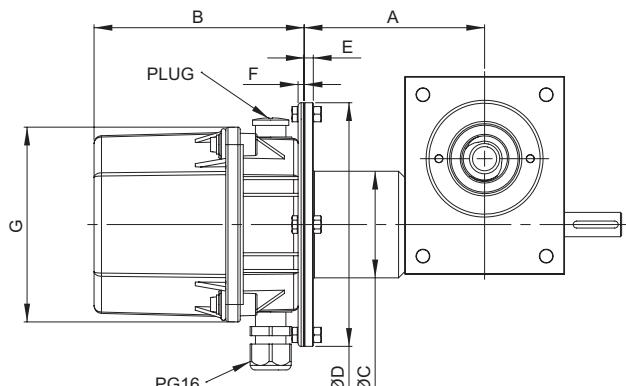

Dimensions

B (mm)			50	50	50	50
C (mm)			10	15	15	20
D (mm)			34	36	41	46
E (mm)± 5			78.5	84	89	100
F Adjustment (mm)			5	5	5	5
ØG (mm)			34	49	61	73

Note:

1. *Structure dimension (C) only required when screw jack is secured on this face. Not required if secured on opposite face.
2. All dimensions in mm unless otherwise stated.
3. Dimensions subject to change without notice.

RLS-51 Rotary cam limit switches can be used as end of travel limit switches with the option of intermediate switches. Each limit switch is individually adjustable over the entire stroke of the screw jack.

- 2 to 8 limit switches in one unit
- Usable revolutions from 4 to 16000
- Switch types include:
Changeover (Normally Closed/Open), Normally Closed, Gold or Silver contacts
- Maintenance free rotary cam gearbox
- Enclosure IP66 as standard
- Mounting options for B14 (face), B5 (flange) and B3 (foot)
- Available in 3 voltages 250VAC, 24VDC & 80VDC
- Maximum input speed 1800rpm
- Operating temperature -40°C to +80°C
- Options for potentiometer, anti-condensation heaters and encoders
- Stage technology option to VBG70

Mounted onto a screw jacks free worm shaft as an alternative where cover pipe mounted limit switches are not possible e.g. rotating screw jacks.

More RLS-51 rotary limit switch details in System Components section of Design Guide.

E-Series Machine Screw Jack

AVAILABLE IN MANY STANDARD MODELS WITH A WIDE RANGE OF CAPABILITIES, THERE IS A STANDARD MODEL FOR ALMOST ANY REQUIREMENT.

TRANSLATING SCREW JACKS**Key Features**

- Standard Performance Power Jack
- Metric Single Face Machine Screw Jacks
- Capacities - 5kN to 2000 kN as standard
- Translating and Rotating Screw in Upright and Inverted types
- Precision Worm Gear Set
- 2 Gear ratios and 2 screw lead options for most sizes
- Anti-backlash and anti-rotation (keyed) options
- 6 mounting options including trunnion and double clevis
- Special custom designs available

**ROTATING SCREW JACKS**

Translating Screw

Upright

Inverted

Rotating Screw

Upright

Inverted

Typical Applications

Conventional Machine Screw Jacks are most widely used for intermittent duty cycles, as the screw jack incorporates a precision worm gear set in a rugged casting delivering positive, precise actuation. Available in a comprehensive range of materials and fittings with the option for special designs for specific application requirements. They are used in wide variety of automation applications including those in steel, automotive, communications, civil, defence, energy, glass and aerospace sectors.

Standard Designs

The standard E-Series screw jack is available in translating and rotating screw designs in capacity sizes from 5kN to 2000kN. The design is optimised for performance, function and reliability with a highly flexible platform for customisation in addition to the standard options. The options and accessories (section-7) list is long and varied and allows you to configure a standard design that is just right for your application. These options include Anti-Backlash, Anti-Rotation (Keyed) and Safety Nut designs.

Special Designs

We can fully customise our screw jacks so that your application can be the best.

Customisation can be anything from a small modification such as an extra bolt hole on an end fitting to a completely new design of screw jack based on our class leading technology.

For more details please see the Special Screw Jack information in Section-8 or contact us today with your requirements. Our team are looking forward to working with you.

Selecting the Right Screw Jack

Consider all application constraints then choose a product that looks suitable for the intended application. Calculate the power and torque requirements. This is a 5 step process:

- Screw Jack Input Speed (RPM)
- Operating Input Power (kW)
- Operating Input Torque (Nm)
- Screw Jack Start-up Torque (Nm)
- Mechanical Power and Torque Check

Systems

The screw jacks can be connected together in systems so that multiple units can be operated and controlled together. These jacking system arrangements or configurations can be built in many formats with the use of bevel gearboxes, motors, reduction gearbox , drive shafts, couplings, plummer blocks and motion control devices.

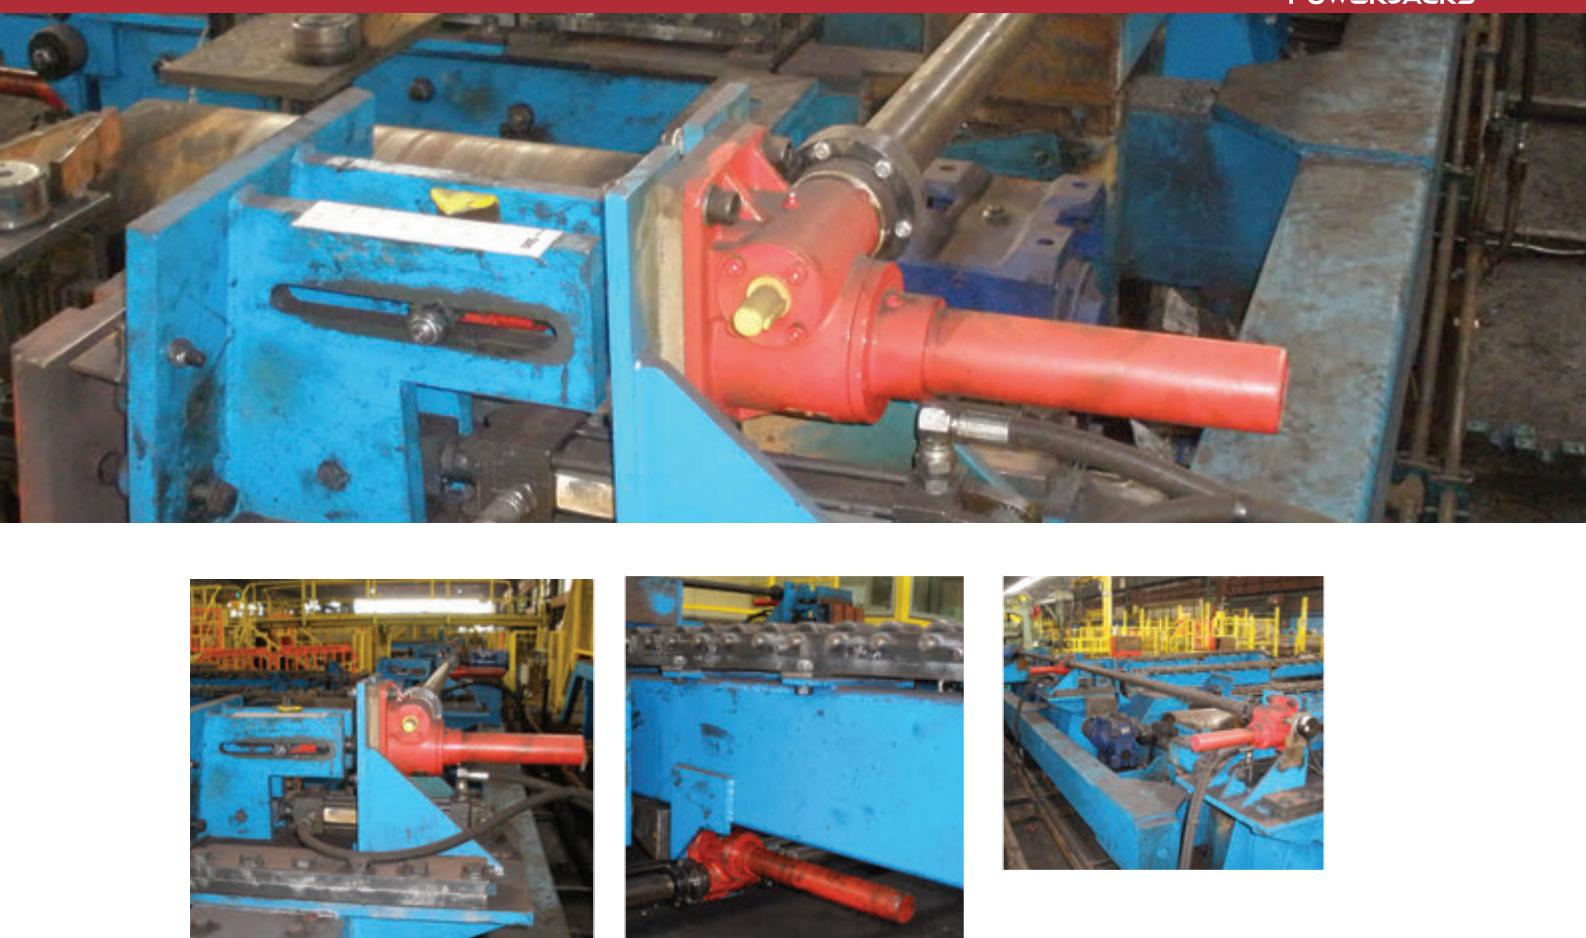

The use of bevel gearboxes allows the distribution of drive throughout a jacking system. The gearboxes come in 2,3 and 4 way drive types. See the Bevel Gearbox Section-10 for more details.

Bevel gearboxes and other system components can also be supplied in stainless steel or other corrosion resistant designs.

Two of the most popular system configurations are the 'H' and 'U' configured jacking systems. Remember that multiple screw jacks can be linked together mechanically or electrically. The latter is useful if there is no space for linking drive shafts.

If multiple machine screw jacks are connected in a mechanically linked system then the complete system may be considered self-locking. If you would like this checked consult Power Jacks. Alternatively, to be sure, include a brake on the system either as a stand alone device or as a brake motor.

ADJUSTABLE TABLE STOPS FOR TATA STEEL PRODUCTION

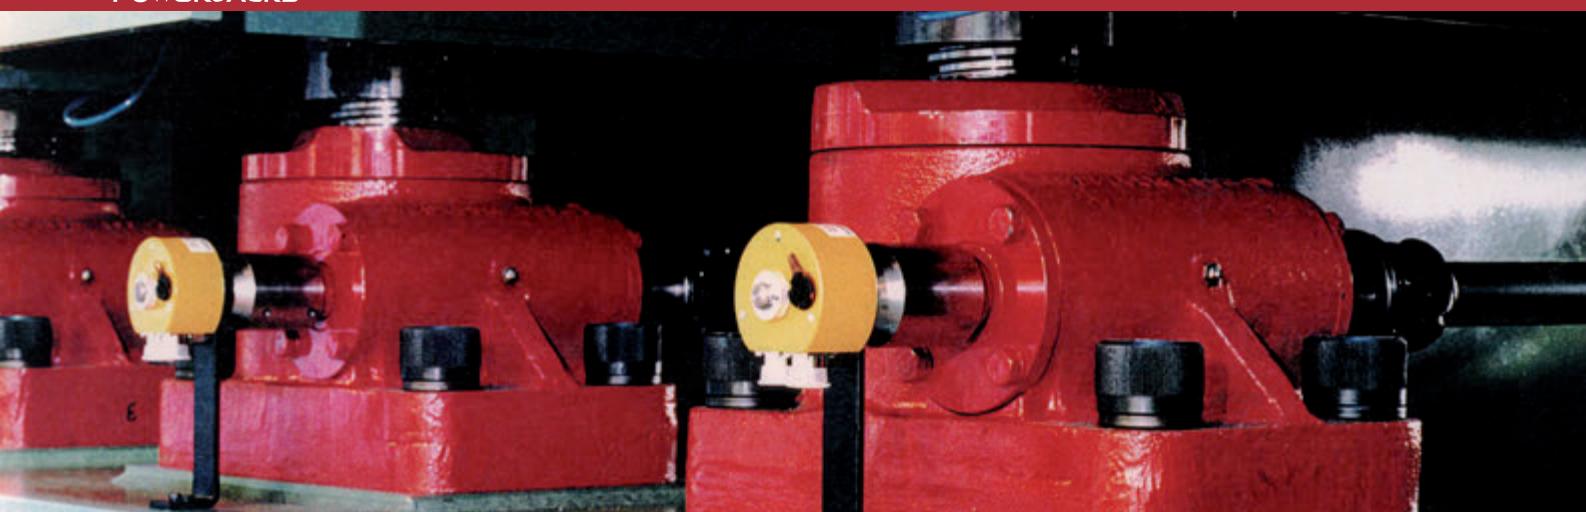

E-Series Machine Screw Jacks are installed on the adjustable table and centring stops for the Rectangular Hollow Sections (RHS) department at TATA Steel Europe 20" pipe mill in Hartlepool.

Automated adjustable stop mechanisms use 50kN E-Series translating machine screw jacks in inverted screw configuration. Each stop mechanism uses a four screw jack system that is driven by one electric motor. The electric motor is positioned in the centre of the system with 2 screw jacks either side.

A bevel gearbox is used to split the drive line to each side from the motor with self-supporting drive shafts (spacer couplings) used to connect each screw jack to the system. One screw jack in each system is fitted with an encoder for speed and position feedback, which is displayed on an electronic display.

For more application examples see the 'Power at Work' brochure or www.powerjacks.com.

BRONX METAL SECTION STRAIGHTENER

Variable centre straighteners for moving the centre straightening rollers, end pinch rollers and the landing legs.

A jacking system for each straightening roller has two special design screw jacks and a strengthened gearbox, rated for a 700kN dynamic capacity in compression. The pinch rollers have their position adjusted by two horizontally opposing screw jacks, driven individually by motorised helical gearboxes.

For more application examples see the 'Power at Work' brochure or www.powerjacks.com.

Notes 4-7 of 7

4. All E-Series screw jacks have grease lubricated gearbox and lead screw as standard.
5. Torque required to prevent the lead screw or lead nut from rotating if no anti-rotation device fitted to screw jack.
6. Radial force applied midway along worm shaft key at 90° to key.
7. Maximum transmittable torque through worm shaft, not through gear set.

Note:

- 1 Inverted Screw Jacks - Bellows Boot Closed Height assumes screw jack mounted on a structure with a thickness = 15mm
- 2 Inverted Screw Jacks - Recommended bellows boot mounting plate ØB x [E + 5mm] thick.
- 3 Inverted Screw Jacks - Screw Jack mounting plate & bellows boot mounting plate are customers own supply
- 4 † Control tapes fitted (increase outer diameter by 20mm approximately).
- 5 For horizontal installations with less than 450 mm of stroke, internal boot guides are recommended.
- 6 Customers with threaded end screw jacks must provide a fixing for the unattached bellows boot collar.
- 7 Bellows boots for Rotating Screw Jacks, other sizes, stroke and materials please consult Power Jacks.

Note:

- 1 Inverted Screw Jacks - Bellows Boot Closed Height assumes screw jack mounted on a structure with thickness = 15mm
- 2 Inverted Screw Jacks - Recommended bellows boot mounting plate ØB x [E +5mm] thick.
- 3 Inverted Screw Jacks - Screw Jack mounting plate & bellows boot mounting plate are customers own supply
- 4 † Control tapes fitted (increase outer diameter by 20mm approximately).
- 5 For horizontal installations with less than 450 mm of stroke, internal boot guides are recommended.
- 6 Customers with threaded end screw jacks must provide a fixing for the unattached bellows boot collar.
- 7 Bellows boots for Rotating Screw Jacks, other sizes, stroke and materials please consult Power Jacks.

E-Series Metric Machine Screw Jack

PERFORMANCE
ENHANCED VARIANTS
TO SOLVE SPECIFIC
APPLICATION
REQUIREMENTS

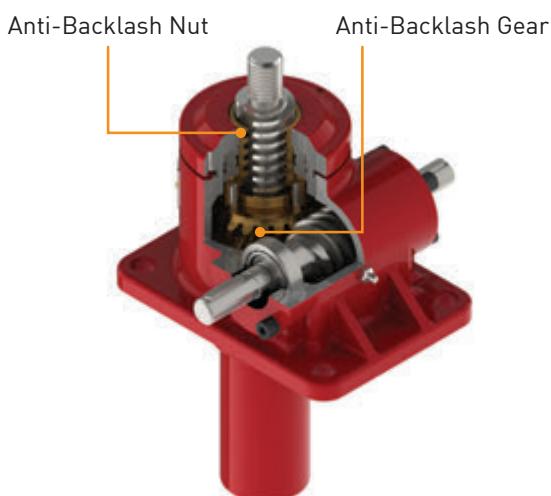

Minimise Axial Backlash for Reversing Loads

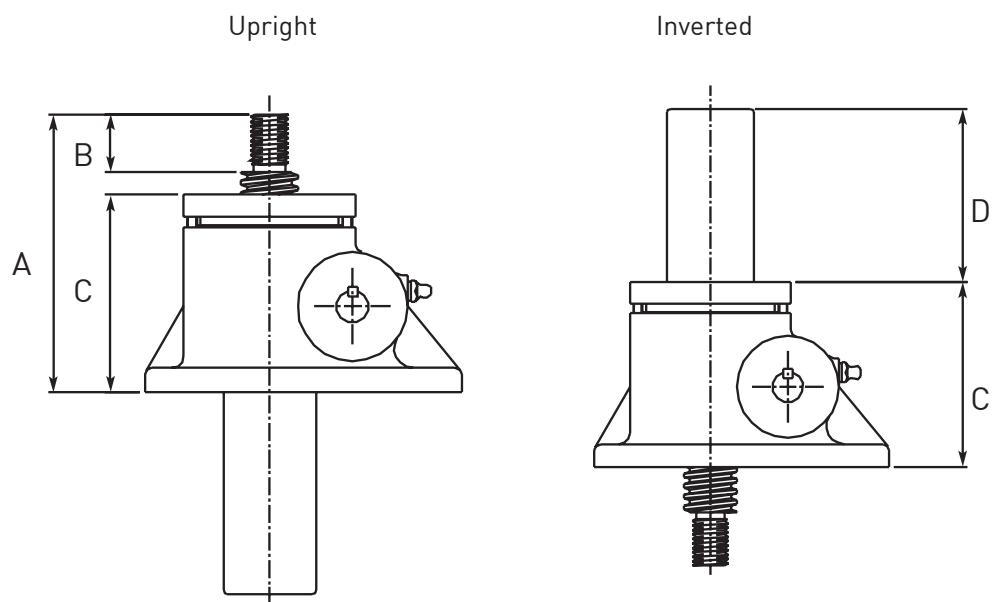

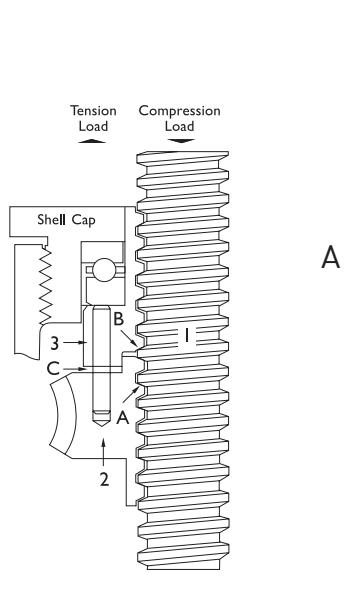

The Anti-Backlash feature provides a reliable method to regulate the axial backlash in a screw jack for applications where there is a reversal of loading from tension to compression. The amount of backlash between the screw and worm gear nut can be adjusted (adjust shell cap) to a desired amount or a practical minimum. To avoid binding and excessive wear do not adjust backlash to less than 0.025mm.

The Anti-Backlash feature also acts as a safety device, providing dual nut load carrying unit, when the worm gear becomes worn.

A visual wear indicator is available on request for all models and a "feeler" gauge can be used to measure the wear. This can be upgraded to use a sensor for wear monitoring. Consult Power Jacks for either option.

Dimensions

How it works -

refer p193

The dimensions for these screw jacks are the same as the standard units except those detailed below.

Note

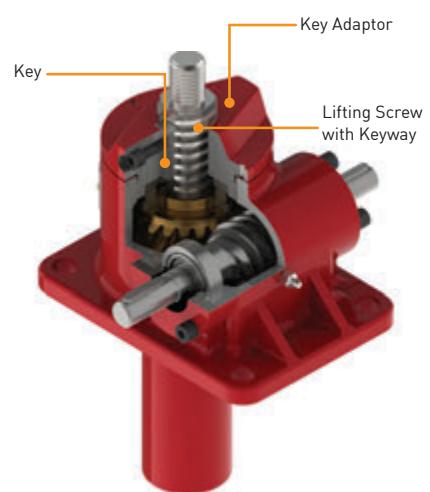

1. All metric machine screws have a trapezoidal thread form.
2. For loads of 25% to 100% of screw jack capacity, torque requirements are approximately proportional to the load.
3. Efficiency values for standard grease lubricated worm gear box and lifting screw.
4. All E-Series screw jacks have grease lubricated gearbox and lead screw as standard.

Linear Movement for Rationally Unconstrained Loads

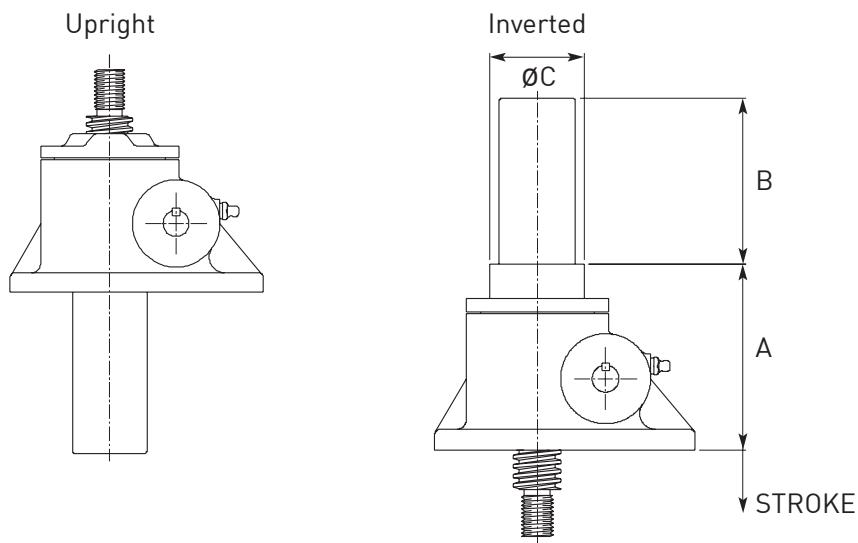

The Anti-Rotation feature for translating screw jacks stops the lifting screw from rotating without the need for end fixing. This is done by keying the lifting screw.

Benefits:

- Compact unit integrates anti-rotation into gearbox
- Dimensions are the same as the standard translating screw jack
- Standard round cover pipe for easy installation
- Proven industrial anti-rotation design

Dimensions

Dimensions for Upright Models with Anti-Rotation (Keyed)

Dimensions for upright E-Series machine screw jacks with anti-rotation (keyed) mechanism are the same as the standard screw jacks without the feature.

Dimensions for Inverted Models with Anti-Rotation (Keyed)

The dimensions for these screw jacks are the same as the standard units except those detailed below.

Note

1. All metric machine screws have a trapezoidal thread form.
2. For loads of 25% to 100% of screw jack capacity, torque requirements are approximately proportional to the load.
3. Efficiency values for standard grease lubricated worm gear box and lifting screw.
4. All E-Series screw jacks have grease lubricated gearbox and lead screw as standard.

Extra Safety for Critical Applications

Power Jacks machine screw jacks can be fitted with a safety nut, which provides 2 safety roles:

1. In the event of excessive wear on the nut thread the load will be transferred from the standard nut to the safety nut. This will also provide visual wear indication as the gap between the safety nut decreases to zero as the standard lifting nut wears.
2. In the unlikely event of catastrophic nut thread failure the safety nut will sustain the load. The safety of industrial and human cargo is therefore improved.

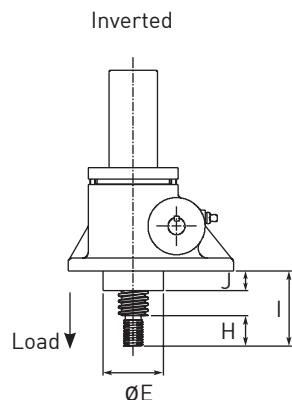

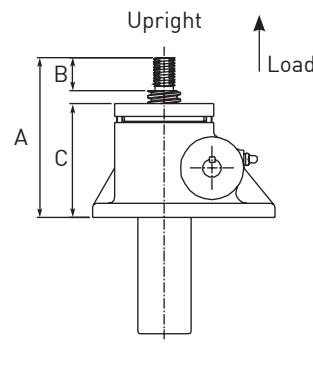

There are several configurations for each safety nut device as they only work in one load direction. For this reason when ordering please supply a sketch of your application showing load directions.

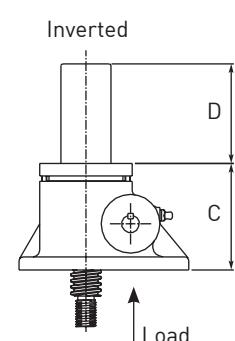

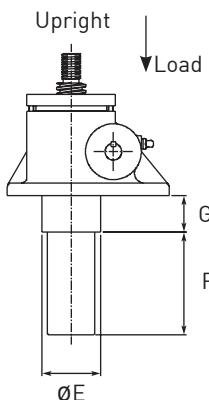

All Safety Nuts are BS EN 1570 Compliant

E-Series Stainless Steel Screw Jacks

**DESIGNED FOR USE IN
HARSH & CORROSIVE
ENVIRONMENTS
CAPACITIES - 10KN TO
1000KN AS STANDARD.**

TRANSLATING SCREW JACKS**Key Features**

- Standard Performance Power Jack
- Stainless Steel Machine Screw Jacks
- Capacities - 10kN to 1000kN as standard
- Translating and Rotating Screw in Upright and Inverted types
- Precision Worm Gear Set
- 2 Gear ratios and 1 screw lead as standard
- Anti-backlash and anti-rotation (keyed) options
- 6 mounting options including trunnion and double clevis
- Special custom designs available

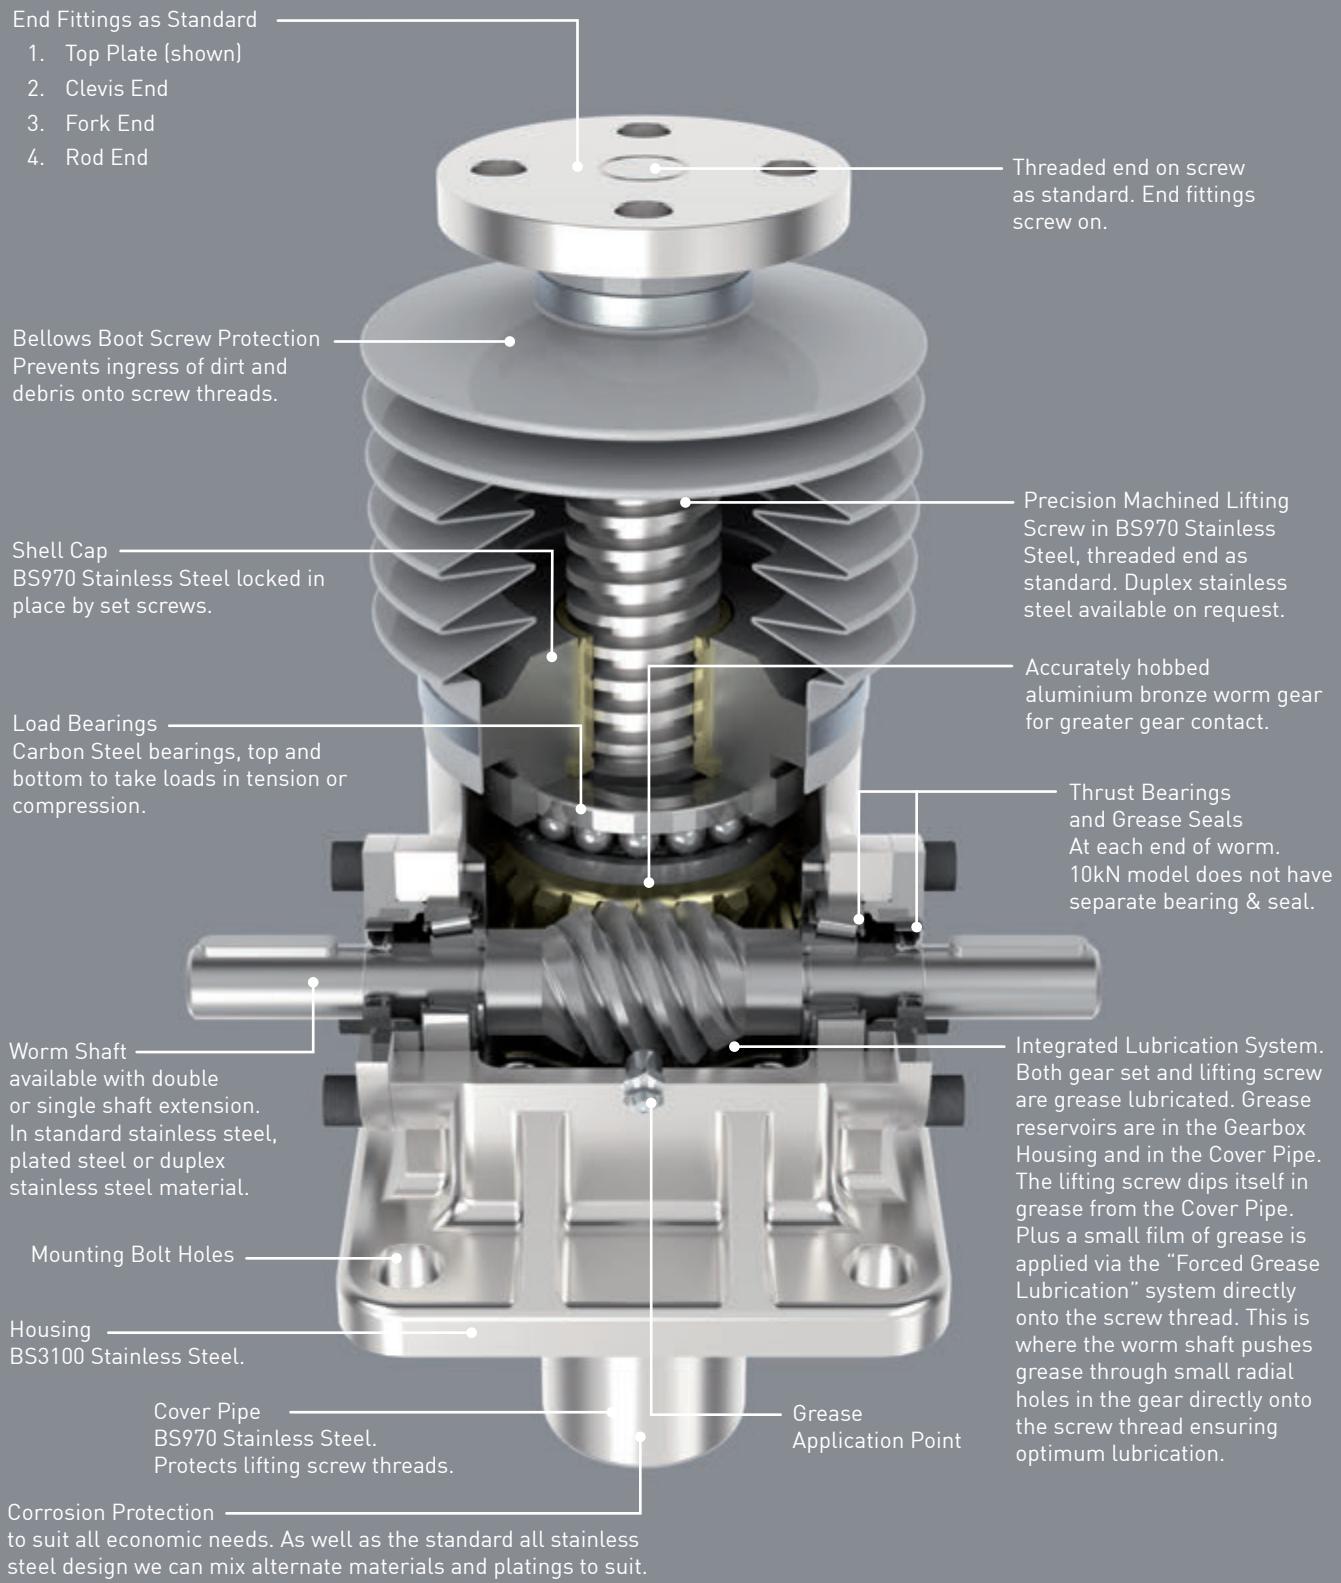

ROTATING SCREW JACKS

4 E-Series - Stainless Steel Screw Jack

92

Features

POWERJACKS

The stainless steel screw jacks are ideal for use in harsh or corrosive environments such as marine, nuclear, water, food processing or paper making machinery, where standard materials may be inadequate.

Translating Screw

Inverted

Rotating Screw

Upright

Inverted

Typical Applications

Stainless Steel Machine Screw Jacks are typically used in harsh or corrosive environments or those with a regular wash down requirement. Industries such as Marine, Water Treatment, Nuclear, Food Processing, Offshore, Pulp and Paper use stainless steel screw jacks. For each application, variants with different material grades or plated components can be used, tailoring the product for the specific application and budget.

Standard Designs

Stainless steel E-Series machine screw jacks are available in translating and rotating screw designs in capacity sizes from 10kN to 1000kN. The design is optimised for reliable performance in some of the most arduous environments. Plus there is a large selection of standard accessories (section-7) and options so you can configure a standard design that is just right for your application. These options include Anti-Backlash, Anti-Rotation (Keyed) and Safety Nut designs.

Special Designs

We can fully customise our screw jacks so that your application can be the best.

Customisation can be anything from a small modification such as an extra bolt hole on an end fitting to a completely new design of screw jack based on our class leading technology.

For more details please see the Special Screw Jack information in Section-8 or contact us today with your requirements. Our team are looking forward to working with you.

Selecting the Right Screw Jack

Consider all application constraints then choose a product that looks suitable for the intended application. Calculate the power and torque requirements. This is a 5 step process:

- Screw Jack Input Speed (RPM)
- Operating Input Power (kW)
- Operating Input Torque (Nm)
- Screw Jack Start-up Torque (Nm)
- Mechanical Power and Torque Check

Systems

The screw jacks can be connected together in systems so that multiple units can be operated and controlled together. These jacking system arrangements or configurations can be built in many formats with the use of bevel gearboxes, motors, reduction gearbox, drive shafts, couplings, plummer blocks and motion control devices.

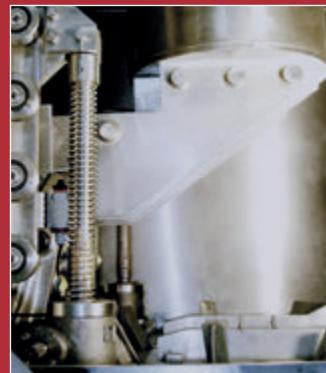

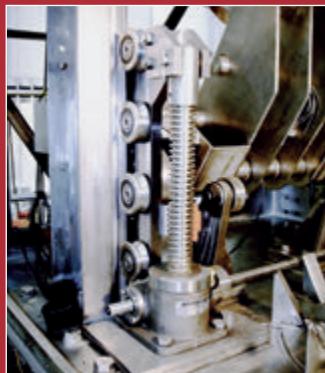

The use of bevel gearboxes allows the distribution of drive throughout a jacking system. The gearboxes come in 2,3 and 4 way drive types. See the Bevel Gearbox Section-10 for more details.

Bevel gearboxes and other system components can also be supplied in stainless steel or other corrosion resistant designs.

Two of the most popular system configurations are the 'H' and 'U' configured jacking systems. Remember that multiple screw jacks can be linked together mechanically or electrically. The latter is useful if there is no space for linking drive shafts.

If multiple machine screw jacks are connected in a mechanically linked system then the complete system may be considered self-locking. If you would like this checked consult Power Jacks. Alternatively, to be sure, include a brake on the system either as a stand alone device or as a brake motor.

DRUM POSTING EQUIPMENT (DPE)

Dunreay cementation plant waste transfer facility.

Raise and lower drum transfer table.

Two stainless steel E-Series translating machine screw jacks 100kN capacity with 24:1 gear ratio and 1805mm stroke connected in series by a stainless steel drive shaft and geared couplings.

For more application examples see the 'Power at Work' brochure or www.powerjacks.com.

Notes

- All metric stainless steel machine screws have a trapezoidal thread form, single start as standard. Other screw lead options are available on request.
- Based on operating capacity for loads of 25% to 100% of screw jack capacity, torque requirements are approximately proportional to the load.
- Efficiency values for standard grease lubricated worm gear box and lifting screw

ENHANCED VARIANTS
TO SOLVE SPECIFIC
APPLICATION
REQUIREMENTS

4 E-Series - Stainless Steel Screw Jack

114 Anti-Backlash

POWERJACKS

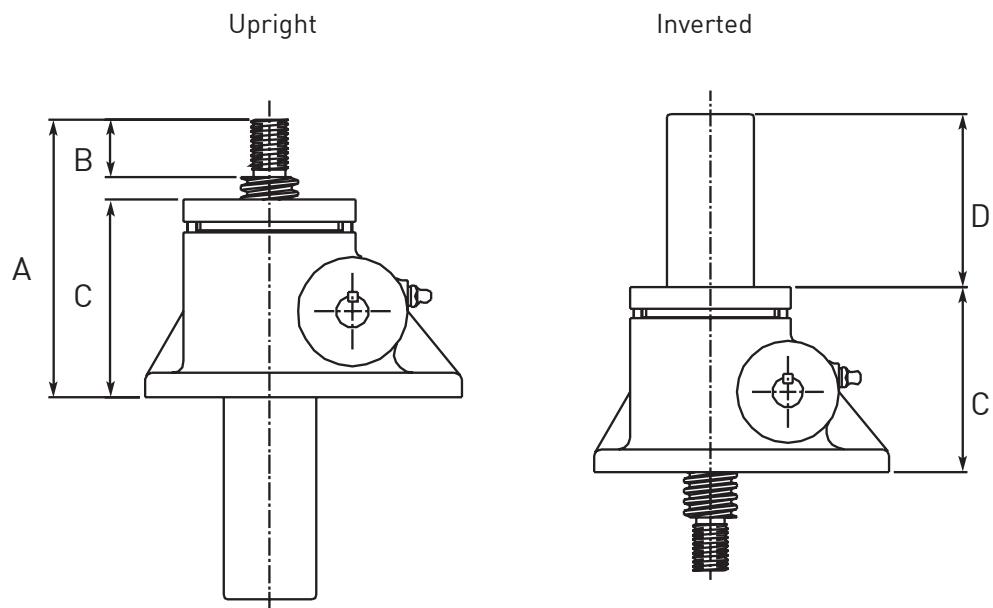

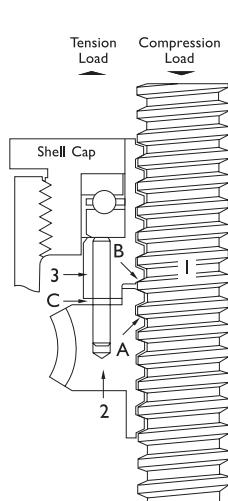

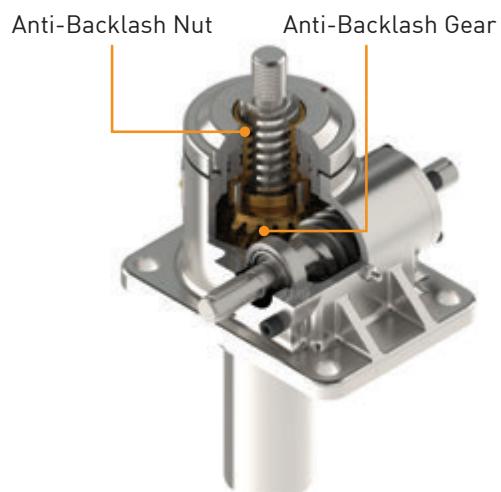

Minimise Axial Backlash for Reversing Loads

The Anti-Backlash feature provides a reliable method to regulate the axial backlash in a screw jack for applications where there is a reversal of loading from tension to compression. The amount of backlash between the screw and worm gear nut can be adjusted (adjust shell cap) to a desired amount or a practical minimum. To avoid binding and excessive wear do not adjust backlash to less than 0.025mm.

The Anti-Backlash feature also acts as a safety device, providing dual nut load carrying unit, when the worm gear becomes worn.

A visual wear indicator is available on request for all models and a "feeler" gauge can be used to measure the wear. This can be upgraded to use a sensor for wear monitoring. Consult Power Jacks for either option.

Dimensions

Note

- All metric machine screws have a trapezoidal thread form.
- For loads of 25% to 100% of screw jack capacity, torque requirements are approximately proportional to the load.
- Efficiency values for standard grease lubricated worm gear box and lifting screw.
- All E-Series screw jacks have grease lubricated gearbox and lead screw as standard.

4 E-Series - Stainless Steel Screw Jack

116 Anti-Rotation (Keyed)

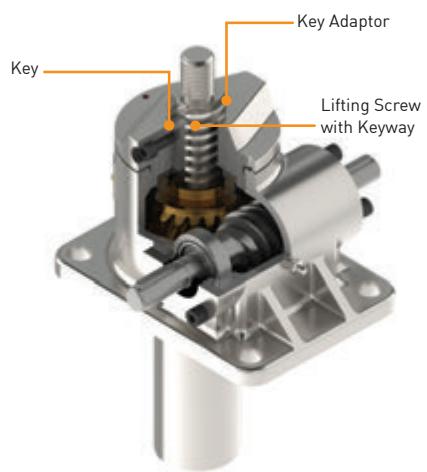

POWERJACKS

Linear Movement for Rotationally Unconstrained Loads

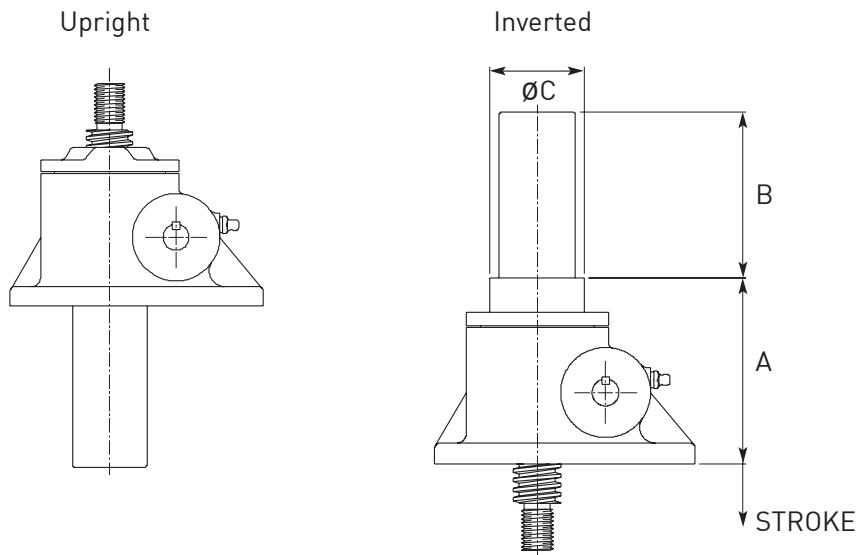

The Anti-Rotation feature for translating screw jacks stops the lifting screw from rotating without the need for end fixing. This is done by keying the lifting screw.

Benefits:

- Compact unit integrates anti-rotation into gearbox
- Dimensions are the same as the standard translating screw jack
- Standard round cover pipe for easy installation
- Proven industrial anti-rotation design

Dimensions

Dimensions for Upright Models with Anti-Rotation (Keyed)

The Dimensions for upright E-Series machine screw jacks with anti-rotation (keyed) mechanism are the same as the standard screw jacks without the feature.

Dimensions for Inverted Models with Anti-Rotation (Keyed)

The dimensions for these screw jacks are the same as the standard units except those detailed below.

Note

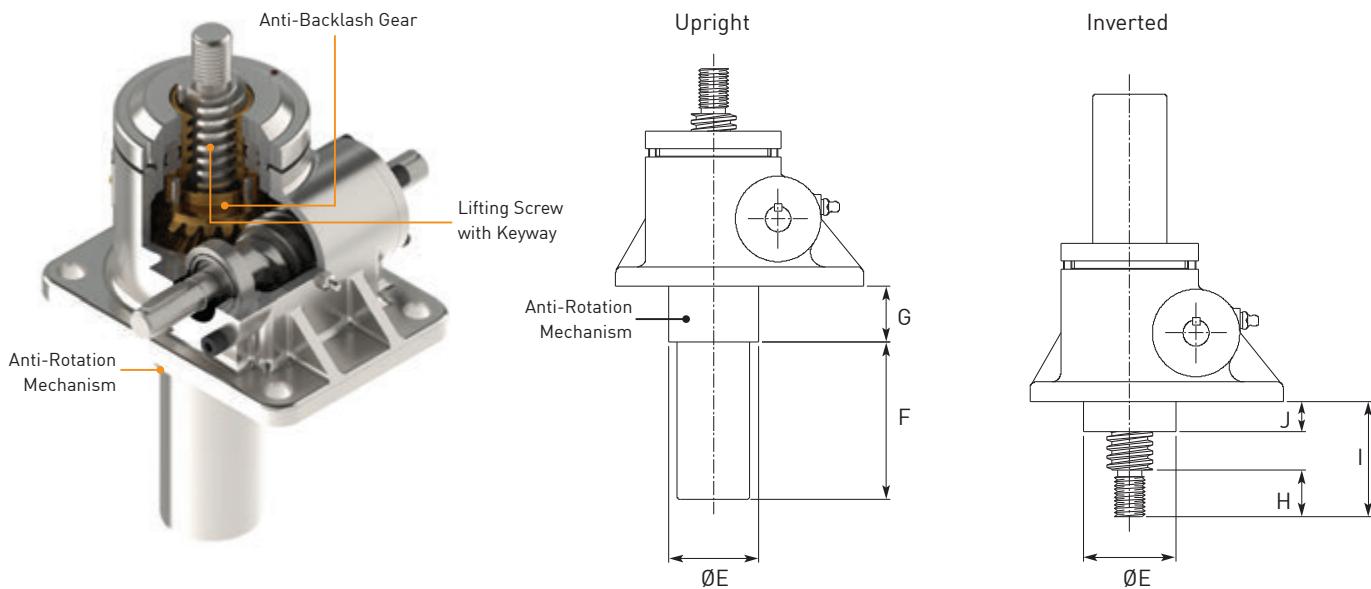

- All metric machine screws have a trapezoidal thread form.
- For loads of 25% to 100% of screw jack capacity, torque requirements are approximately proportional to the load.
- Efficiency values for standard grease lubricated worm gear box and lifting screw.
- All E-Series screw jacks have grease lubricated gearbox and lead screw as standard.

- Efficiency values for standard grease lubricated worm gear box and lifting screw.
- All E-Series screw jacks have grease lubricated gearbox and lead screw as standard.

4 E-Series - Stainless Steel Screw Jack

120 Safety Nut

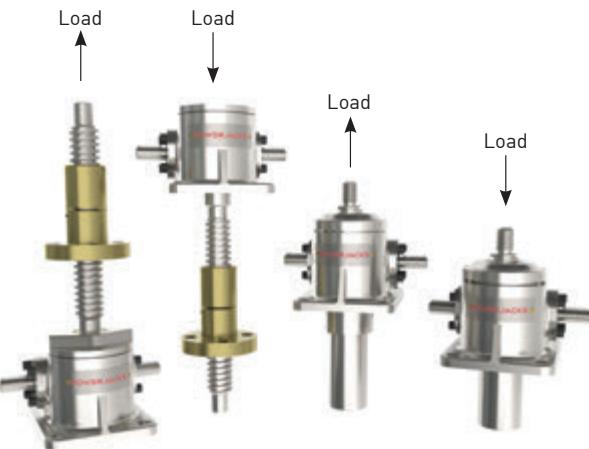

POWERJACKS

Extra Safety for Critical Applications

Power Jacks metric machine screw jacks can be fitted with a safety nut, which provides 2 safety roles:

1. In the event of excessive wear on the nut thread the load will be transferred from the standard nut to the safety nut. This will also provide visual wear indication as the gap between the safety nut decreases to zero as the standard lifting nut wears.
2. In the unlikely event of catastrophic nut thread failure the safety nut will sustain the load. The safety of industrial and human cargo is therefore improved.

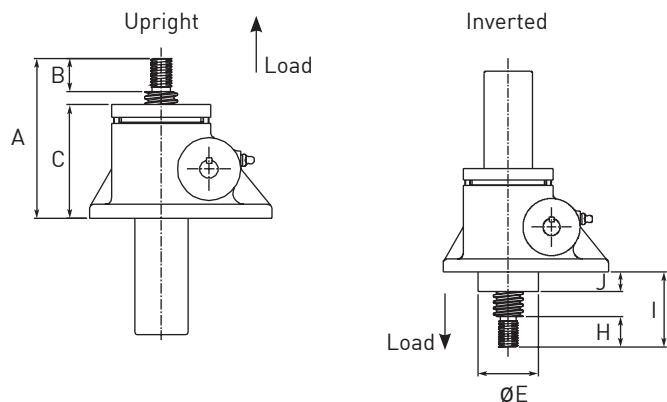

There are several configurations for each safety nut device as they only work in one load direction. For this reason when ordering please supply a sketch of your application showing load directions.

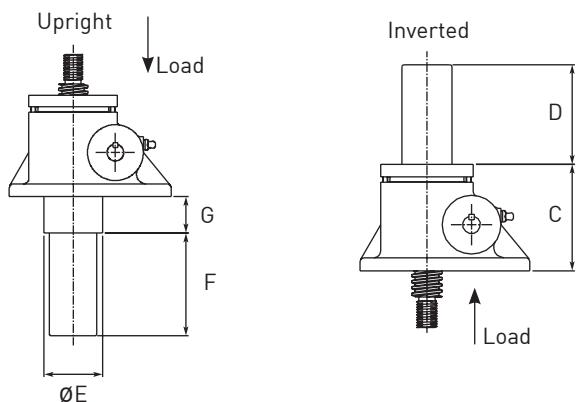

All Safety Nuts are BS EN 1570 Compliant

E-Series Ball Screw Jack

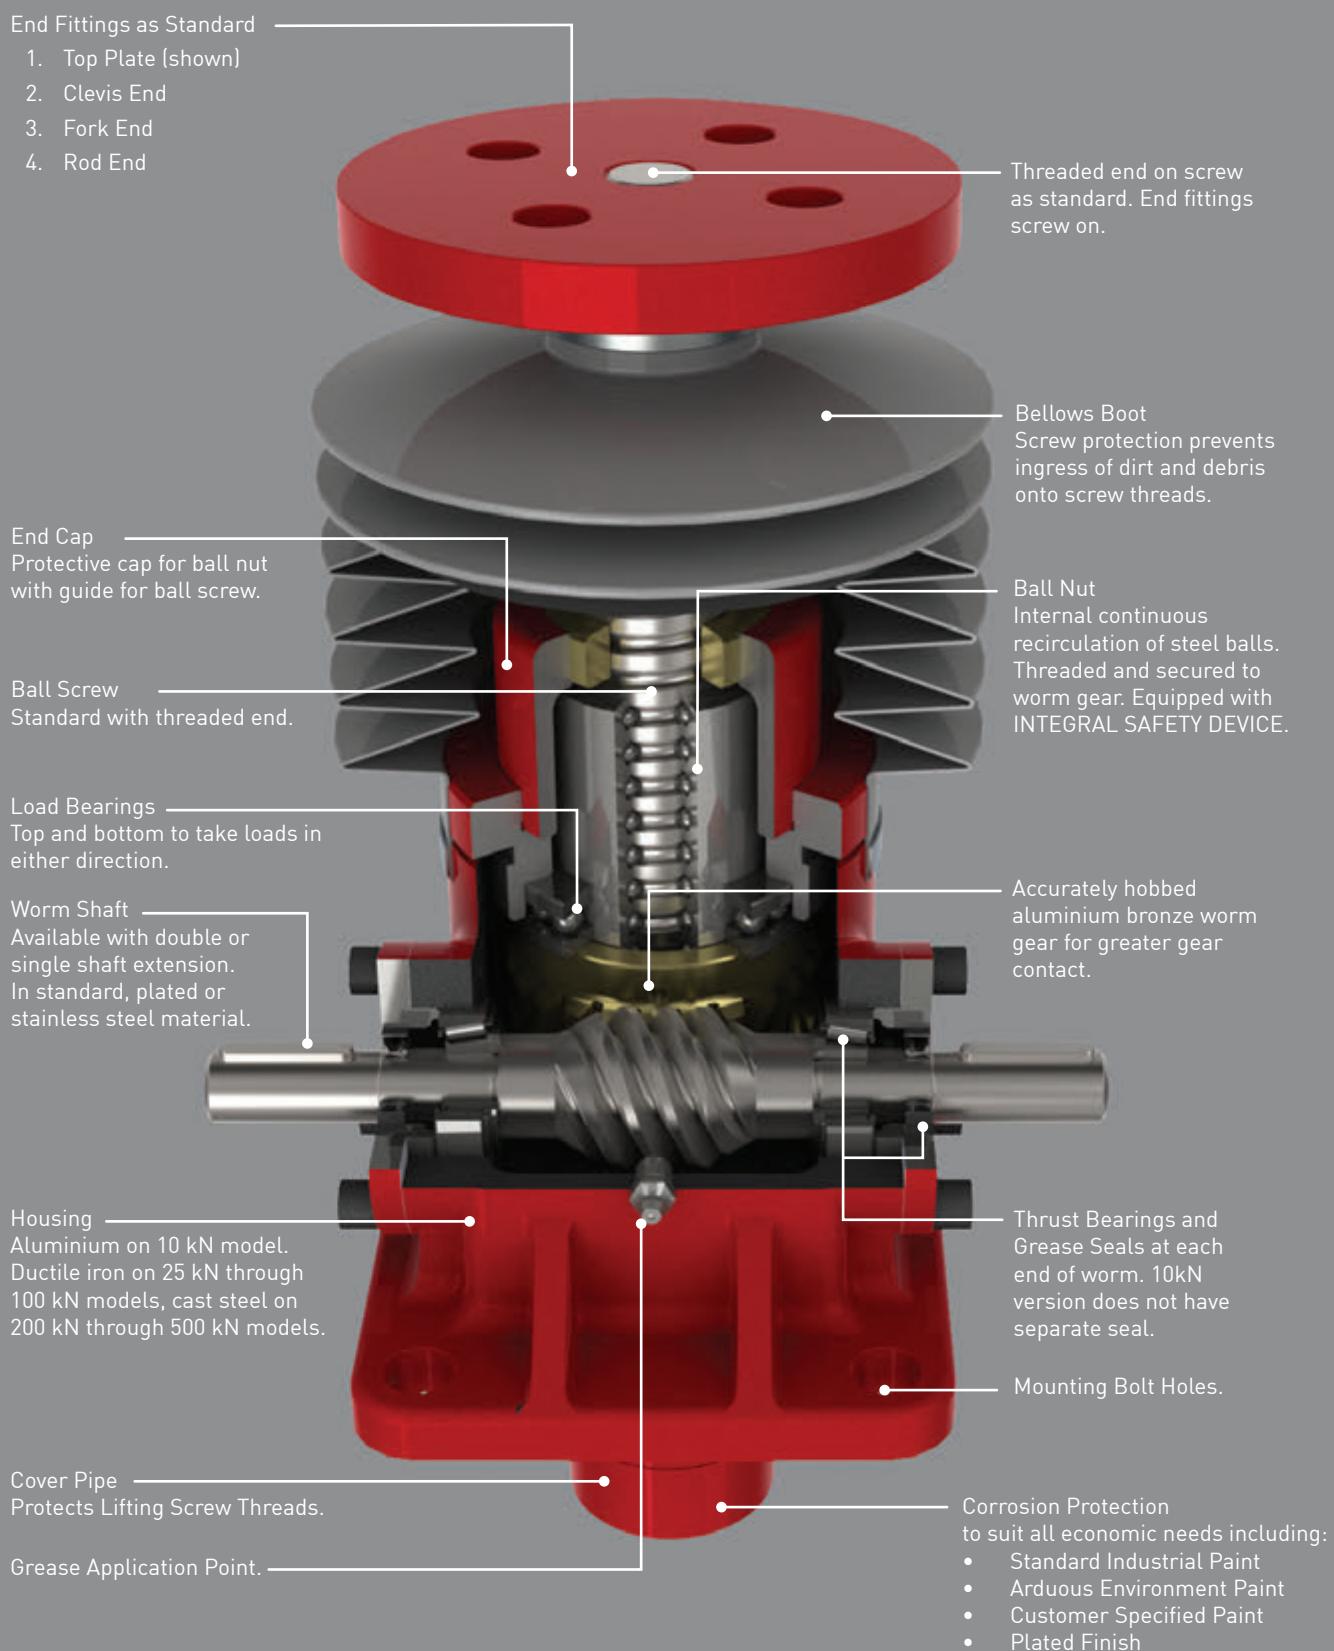

HIGH EFFICIENCY BALL SCREW JACK IN A COMPACT DESIGN WITH INTEGRATED SAFETY DEVICE.

Overall operating efficiency is as high as 70% in some models, depending on the worm gear ratio.

TRANSLATING SCREW JACKS**Features**

- High Efficiency Power Jack
- Metric Single Face Ball Screw Jacks
- Capacities - 10kN to 300 kN as standard
- Integral Safety Device for 25kN & above as standard
- Translating and Rotating Screw in Upright and Inverted types
- Precision Worm Gear Set and Ball Screw Drive
- 2 Gear ratios and 2 screw leads as standard
- Pre-loaded and Anti-rotation ball screw options
- 6 mounting options including trunnion and double clevis
- Special custom designs available

ROTATING SCREW JACKS

Typical Applications

Ball Screw Jacks are generally used when the application has a relatively high duty cycle or the input power for a given screw jack is to be minimised. The high efficiency of the ball screw & nut significantly increase the efficiency of a screw jack in comparison to a Machine Screw Jack. Due to their high efficiency they nearly always require a brake to hold position. They are used in a wide variety of applications including Automotive, Steel, Glass, Defence, Nuclear and Solar industries.

Standard Designs

The standard E-Series ball screw jack is available in translating and rotating screw designs in capacity sizes from 10kN to 500kN. The design is optimised for performance and a compact form, which includes an added safety device as standard for most models. There is a large selection of options and accessories (section-7) that allows you to configure a standard design that is just right for your application. These options include Zero-Backlash and Anti-Rotation designs.

Special Designs

We can fully customise our screw jacks so that your application can be the best.

Customisation can be anything from a small modification such as an extra bolt hole on an end fitting to a completely new design of screw jack based on our class leading technology.

For more details please see the Special Screw Jack information in Section-8 or contact us today with your requirements. Our team are looking forward to working with you.

Selecting the Right Screw Jack

Consider all application constraints then choose a product that looks suitable for the intended application. Calculate the power and torque requirements. This is a 5 step process:

- Screw Jack Input Speed (RPM)
- Operating Input Power (kW)
- Operating Input Torque (Nm)
- Screw Jack Start-up Torque (Nm)
- Mechanical Power and Torque Check

Systems

The screw jacks can be connected together in systems so that multiple units can be operated and controlled together. These jacking system arrangements or configurations can be built in many formats with the use of bevel gearboxes, motors, reduction gearbox , drive shafts, couplings, plummer blocks and motion control devices.

The use of bevel gearboxes allows the distribution of drive throughout a jacking system. The gearboxes come in 2,3 and 4 way drive types. See the Bevel Gearbox Section-10 for more details.

Bevel gearboxes and other system components can also be supplied in stainless steel or other corrosion resistant designs.

Two of the most popular system configurations are the 'H' and 'U' configured jacking systems. Remember that multiple screw jacks can be linked together mechanically or electrically. The latter is useful if there is no space for linking drive shafts.

If multiple ball screw jacks are connected in a mechanically linked system then the complete system in some designs may be considered self-locking. If you would like this checked consult Power Jacks. Alternatively, to be sure, include a brake on the system either as a stand alone device or as a brake motor.

CAVENDISH LABORATORY ANTENNA DISH

Position adjustment of Arcminute Microkelvin Imager (AMI) to achieve a pointing accuracy of better than half a minute of arc (1/120 of a degree). 10 x antenna dishes all in close proximity of each other. Measuring the weight of the universe by analysing “dark matter”.

10 x off 50kN E-Series special metric ball screw jacks based on EBT0050 in translating screw configuration with a stroke of 1050mm. These ball screw jacks operate in normal UK outdoor conditions and allow the antenna to operate at wind speeds of up to 50mph.

For more application examples see the ‘Power at Work’ brochure or www.powerjacks.com.

Note

- Efficiency values for standard grease lubricated worm gear box and lifting screw.

Power Jacks ball nut employs the internal ball transfer system for recirculating the balls. This design provides for:

- Robust design
- Small ball nut body outer diameter
- Smooth movement
- Less turns per circuit
- Absence of parts liable to wear.

Solid formed nylon wiper seals on the ball nut prevents ingress of foreign matter and retain lubrication within the nut.

Standard

Ball Screw Life

Theoretical service life can be expressed in either $L_{10} 10^6$ revolutions or $L_h 10^3$ hours or L_d kilometres. As the life of a ball screw is determined by metal fatigue it is not possible to accurately predict life. However, it is practical to suppose that 90% of a sufficiently large number of equally sized ball screws running under equal working conditions will reach L_{10} or L_h without evidence of material fatigue. The L_{10} ball screw life is rated using the Dynamic Capacity, which is the maximum constant axial load that can be applied in running conditions for a life of 1.10^6 revolutions of the ball screw. This can be expressed in linear travel (L_d).

Where L_{10} = Service Life (millions of revolutions)

$$L_d = L_{10} * P$$

L_d = Service Life (km)

P = Pitch of Ball Screw (mm)

Linear Travel L_d in km			Working Load (kN)										
Model	Capacity (kN)	Pitch (mm)	5	10	25	30	50	75	100	150	200	250	300
E28501	10	5	20.5	2.5	-	-	-	-	-	-	-	-	-
E3802	25	5	381	48	3	-	-	-	-	-	-	-	-
E38021	25	10	1 775	222	14	-	-	-	-	-	-	-	-
E3805	50	10	11 978	1 497	96	55	12	-	-	-	-	-	-
E38051	50	20	17 039	2 130	136	79	17	-	-	-	-	-	-
E3810	100	10	32 287	4 036	258	149	32	10	4	-	-	-	-
E38101	100	20	38 503	4 813	308	178	39	11	5	-	-	-	-
E3820	200	10	162 327	20 291	1 299	752	162	48	20	6	3	-	-
E38201	200	20	320 060	40 008	2 560	1 482	320	95	40	12	5	-	-
E3830	300	20	903 882	112 985	7 231	4 185	904	268	113	33	14	7	4

Use the following formulae to calculate the service life in terms of hours running:

Where L_h = Service Life (hours)

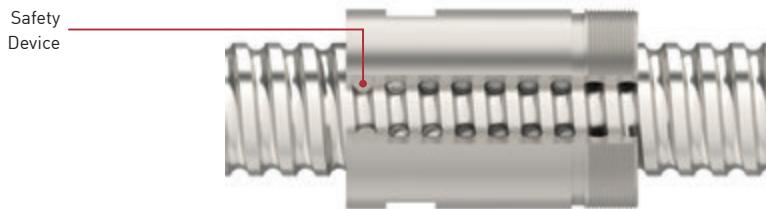

L_{10} = Service Life (revolutions)

n_m = Mean Screw Jack Input Speed (rpm)

Gr = Gear Ratio

Note: 1. Ball screw life based on dynamic load calculated according to DIN69051 Part 4.

Extra Safety As Standard with Integral Safety Device

25kN TO 200kN Power Jacks Metric Ball Screw Jacks have an integral safety device as standard. This provides two important safety roles:

1. In the unlikely event of an excessive wear in the ball screw drive, the safety device will contact the screw shaft and act as an "ACME" Thread. This will provide early warning of any possible ball screw failure and is capable of providing drive in the event of any such failure. This can allow a control system to alert an operator to wear of this kind by monitoring the increase in motor current required to drive the system due to the increased friction generated by the device.
2. It allows the ball nut on the screw jack to sustain a load in the event of catastrophic ball failure. The safety of industrial and human cargo is therefore improved. Ball screw systems without this device could collapse under load or drop the carried load.

Note: Model 10kN & 300kN ball screw jack does not have safety device as standard, if required consult Power Jacks Ltd.

Optimal Ball Nut Alignment & Load Capability

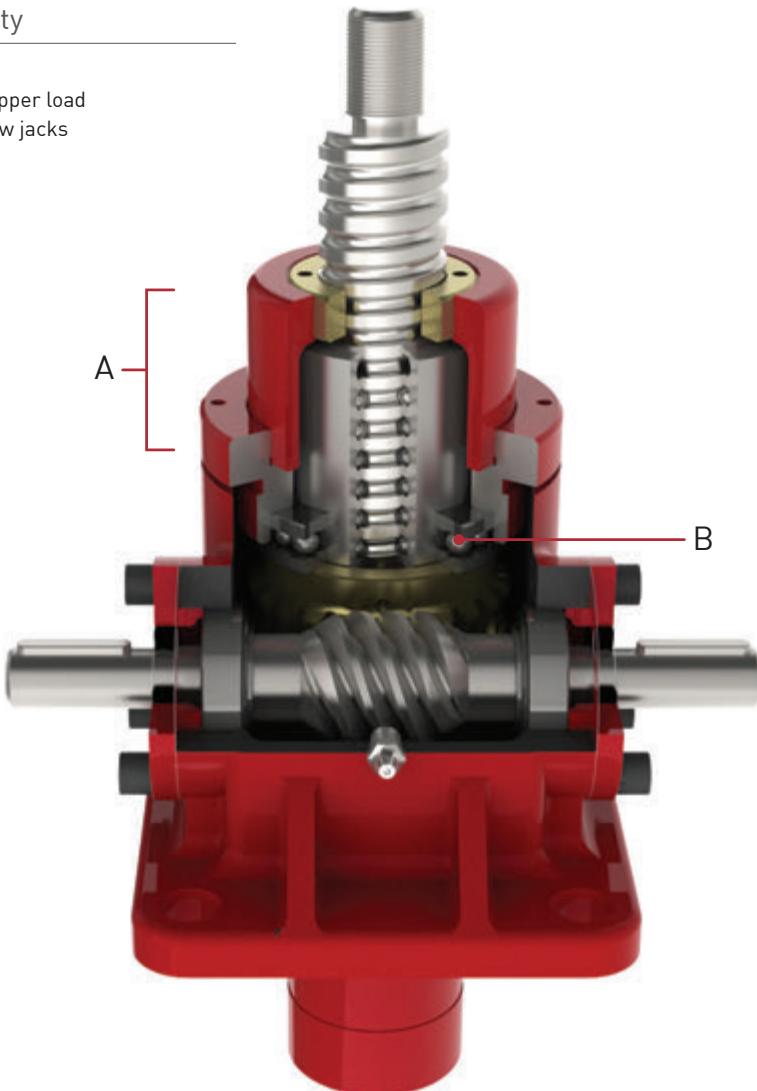

Better by Design Power Jacks Ball Screw Jacks mount the upper load bearing directly on top of the gear the same as all other screw jacks in our range.

Advantages:

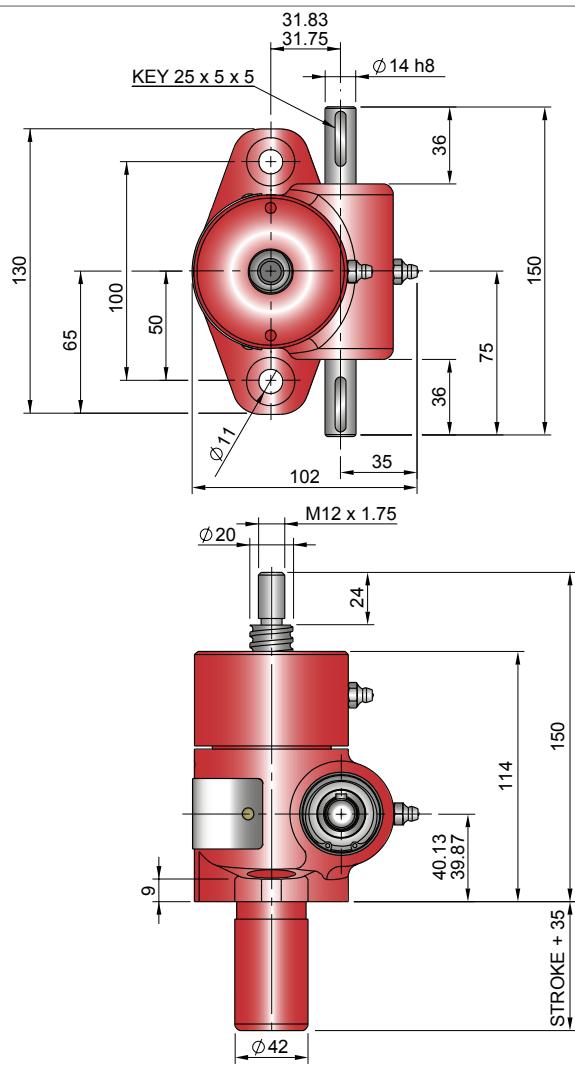

- A. Compact Design
- B. Optimum Gear Holding & Accuracy

EBT0300	20	30	50	70

Note:

- 1 Inverted Screw Jacks - Bellows Boot Closed Height assumes screw jack mounted on a structure with thickness = 30mm
- 2 Inverted Screw Jacks - Recommended bellows boot mounting plate ØB x (E +5mm) thick.
- 3 Inverted Screw Jacks - Screw Jack mounting plate & bellows boot mounting plate are customers own supply
- 4 † Control tapes fitted (increase outer diameter by 20mm approximately).
- 5 For horizontal installations with than 450 mm of stroke, internal boot guides are recommended.
- 6 Customers with threaded end screw jacks must provide a fixing for the unattached bellows boot collar.
- 7 Bellows boots for Rotating Screw Jacks, other sizes, stroke and materials please consult Power Jacks.

Reduced Backlash Ball Screw Jacks

Metric Ball Screw Jacks can be provided with preloaded ball nuts to give reduced axial backlash as a high efficiency alternative to the metric machine screw anti-backlash option. Preloading on the ball nut is obtained by the "Interference Ball" method. By fitting Interference balls in the ball nut to obtain a diametrical interference fit and using the original track form, a four-point contact results.

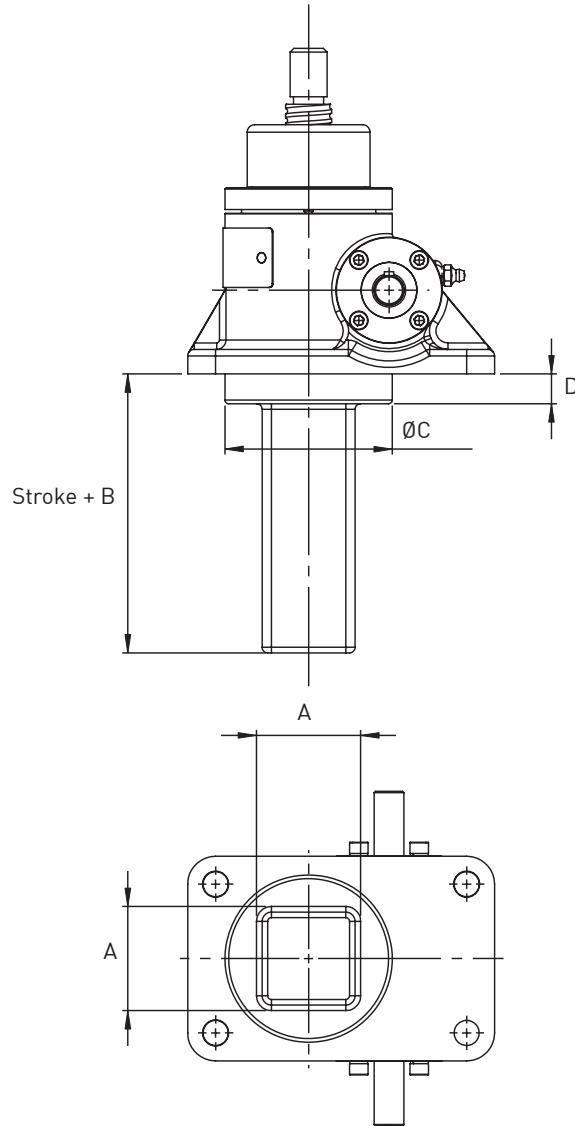

The anti-rotation device is available for translating ball screw models only. It is used only when the load to be moved (actuated) may rotate, i.e. the screw is unguided and does not prevent rotation.

The anti-rotation device consists of a square steel tube which guides the movement of a square aluminium bronze guide block fitted to the end of the ball screw. The guide block also acts as a stop nut.

E-Series Roller Screw Jack

HIGH PRECISION
PLANETARY ROLLER SCREW
INTEGRATED WITH OUR
FLEXIBLE E-SERIES DESIGN
FOR A SCREW JACK THAT
MEETS THE NEEDS OF
HIGH DUTY & HIGH LOAD
APPLICATIONS.

Features

- High Performance Power Jack
- Metric Single Face Roller Screw Jacks
- Capacities - up to 1000kN as standard
- High precision planetary roller screw
- Translating and Rotating Screw in Upright and Inverted types
- Precision Worm Gear Set
- 2 Gear ratios and 2 screw leads as standard
- Anti-Rotation Option
- 6 mounting options including trunnion and double clevis
- Special custom designs available

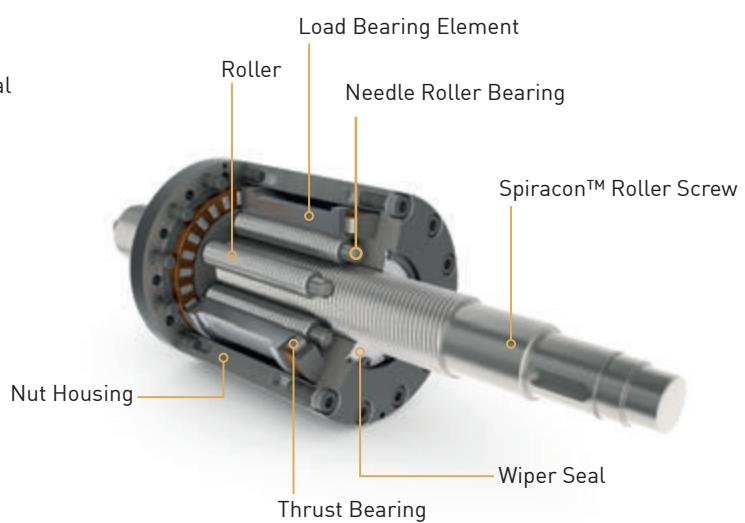

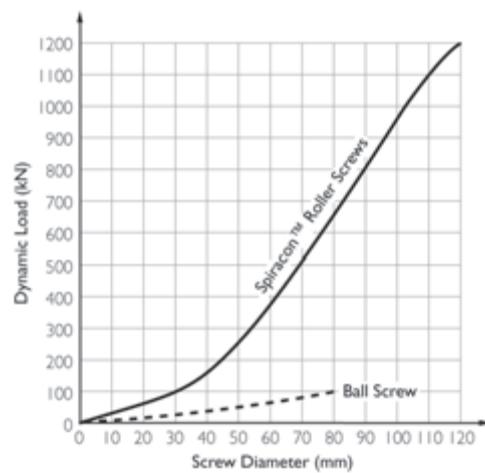

An extensive range of axially translating and rotating screw jacks fitted with the patented Spiracon roller screw and designed specifically to customers' application requirements. The Spiracon roller screw is an extremely high performance screw mechanism exhibiting almost no axial backlash and is designed to meet the following demands:

- High precision and repeatable positioning
- High speed
- High dynamic load capacity
- High duty
- High efficiency
- Long life
- Minimum maintenance requirements

The range covers lifting capacities up to 1000kN, with many design features available to meet the customers' particular requirements. The units' gearbox is based on the standard range of Power Jacks screw jacks, although other gearbox types can be designed for specific applications. The gearboxes are either grease or oil lubricated depending on the application. The roller screw is based around the standard Spiracon planetary roller screw range, with alternative nut housings available to meet the requirements of specific applications.

Principle of Operation

The Spiracon™ system consists of a multi-start screw with an involute thread form and a number of planetary rollers with annular grooves, which engage with the screw. These rollers also engage with a grooved load bearing element, which transmits the load through roller thrust bearings, to the nut housing. The rolling action results in a high efficiency mechanism, while the line contact and hardened and ground construction achieves a high dynamic load carrying capacity, together with almost no axial backlash or wear.

Typical Applications

Roller Screw Jacks are generally used when the application is moving a high load with a high duty cycle. Size for size roller screws offer higher load carrying capabilities than ball screws so for high load applications allow for more compact working envelopes. The high efficiency of the roller screw & nut significantly increase the efficiency of a screw jack in comparison to a Machine Screw Jack. Due to their high efficiency they nearly always require a brake to hold position. They are used in a wide variety of applications including Automotive, Steel, Defence and Nuclear.

Standard Designs

The standard E-Series roller screw jack is available in translating and rotating screw designs in capacity sizes up to 1000kN. The design is optimised for high load and high performance in a compact form. There is a large selection of options and accessories (section-7) available so you can configure a standard design that is just right for your application.

These options include Low-Backlash and Anti-Rotation designs.

Special Designs

We can fully customise our screw jacks so that your application can be the best.

Customisation can be anything from a small modification such as an extra bolt hole on an end fitting to a completely new design of screw jack based on our class leading technology.

For more details please see the Special Screw Jack information in Section-8 or contact us today with your requirements. Our team are looking forward to working with you.

Selecting the Right Screw Jack

Consider all application constraints then choose a product that looks suitable for the intended application. Calculate the power and torque requirements. This is a 5 step process:

- Screw Jack Input Speed (RPM)
- Operating Input Power (kW)
- Operating Input Torque (Nm)
- Screw Jack Start-up Torque (Nm)
- Mechanical Power and Torque Check

Systems

The screw jacks can be connected together in systems so that multiple units can be operated and controlled together. These jacking system arrangements or configurations can be built in many formats with the use of bevel gearboxes, motors, reduction gearbox , drive shafts, couplings, plummer blocks and motion control devices.

The use of bevel gearboxes allows the distribution of drive throughout a jacking system. The gearboxes come in 2, 3 and 4 way drive types. See the Bevel Gearboxes Section-10 for more details.

Bevel gearboxes and other system components can also be supplied in stainless steel or other corrosion resistant designs.

Two of the most popular system configurations are the 'H' and 'U' configured jacking systems. Remember that multiple screw jacks can be linked together mechanically or electrically. The latter is useful if there is no space for linking drive shafts.

If multiple roller screw jacks are connected in a mechanically linked system then the complete system in some circumstances may be considered self-locking depending on the gear ratios and efficiencies of units in the system. In general, Power Jacks recommend a brake is used on **ALL** Roller Screw Jack systems. If you would like this checked, consult Power Jacks. Alternatively, to be sure, include a brake on the system either as a stand alone device or as a brake motor.

Note

1. M = For Machine Screw Jacks
2. N = For Ball Screw Jacks, Standard Lead only.

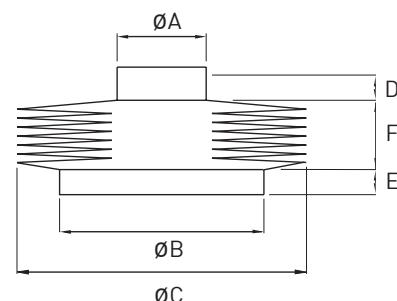

Features

- Protects the screw from dust and dirt
- Guards against moisture and corrosive contaminants
- Helps maintain the proper lubrication
- Boots are made of P.V.C. coated nylon with sewn construction. Other materials are available for applications involving high temperatures, highly corrosive atmospheres and other special conditions.

Closed Heights

Notes for all metric machine screw jacks with bellows boots

1. Supplied complete with a set of corrosion-resistant 'jubilee' clips [2] suitable for fitting over collar diameters.
 2. † Control tapes are fitted (approximately 20 mm increase to outer diameter).
 3. For horizontal installation exceeding 450 mm of travel, internal boot guides are recommended.
 4. Customers with threaded end screw jacks must provide a fixing for the unattached collar (★).
 5. Bellows boots for Rotating Screw Jacks consult Power Jacks Ltd.
 6. For other sizes, strokes and materials please consult Power Jacks Ltd.
 7. All dimensions in millimetres unless otherwise stated.
 8. Dimensions subject to change without notice.
 9. Screw Jack mounting plate and bellows boot mounting plate are usually all part of the customers superstructure (★ ★).
- For other options consult Power Jacks.

Features

- Protects the screw from dust and dirt
- Guards against moisture and corrosive contaminants
- Helps maintain the proper lubrication
- Boots are made of P.V.C. coated nylon with sewn construction. Other materials are available for applications involving high temperatures, highly corrosive atmospheres and other special conditions.

	Stroke 1051 → 1500	80	70	70	70	70	70

Note

1. F = Bellows boot minimum closed thickness
2. - = Not applicable consult Power Jacks Ltd
3. † = Control tapes fitted (approximately 20 mm increase to outer diameter).
4. Supplied complete with a set of corrosion-resistant 'jubilee' clips (2) suitable for fitting over collar diameters.
5. For horizontal installation exceeding 450 mm of travel, internal boot guides are recommended.
6. Customers with threaded end screw jacks must provide a fixing for the unattached collar (★).
7. Bellows boots for rotating screw jacks consult Power Jacks Ltd.
8. For other sizes, strokes and materials please contact Power Jacks Ltd.
9. All dimensions in millimetres unless otherwise stated.
10. Dimensions subject to change without notice.
11. Screw Jack mounting plate and bellows boot mounting plate are usually all part of the customers superstructure (★★). For other options consult Power Jacks.

Notes:

- Material: Polished aluminium casting and rotating handle
- Bored and keyed to BS4235 Part 1
- All dimensions in millimetres unless otherwise stated
- Other types of hand wheels are available on request. Consult Power Jacks.

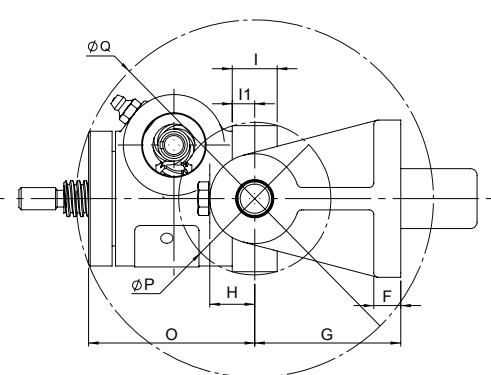

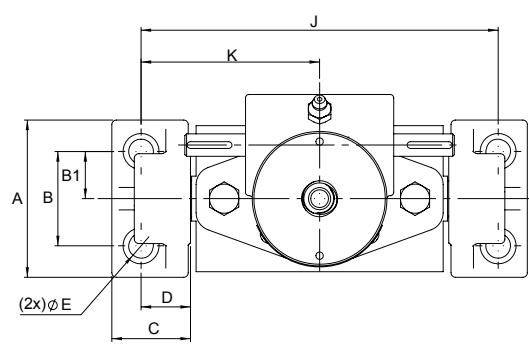

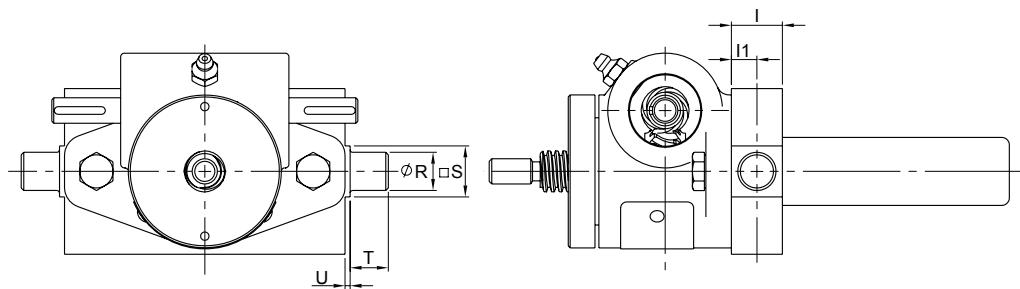

Base mounted trunnions are an ideal bolt-on accessory for a screw jack to add a pivot point to the gearbox of the screw jack. These base mounted trunnions can be used for both translating and rotating screw jacks with any lifting screw type.

Available in both male or female designs with the option to add standard trunnion feet. Most designs offer trunnions in 2 mounting positions.

If you need trunnions fitted at another position on a screw jack then please contact us as we can provide customised trunnion mounts to suit your exact applications needs.

- Standard adapters for 25 kN - 200 kN metric machine screw and ball screw jacks
- Designed for standard IEC frame sizes
- Allows direct motor coupling on either side of the screw jack input shaft
- Complete with drive coupling and mounting hardware

Note

- When direct coupling a motor to a screw jack, it is necessary to match motor power to screw jack load so the motor does not exceed the maximum power for the screw jack gear set.

Notes:

1. Motor Adapters for IEC Frames with B5 Flange mounts available on request.
2. Motor Adapters for screw jacks of capacities 300kN and above are available on request.
3. Adapters for geared motors are available on request for all types of geared motor or gear head.
4. Motor Adapters for Servo Motors available on request.
5. Motor Adapters for NEMA Frame motors are available on request.
6. All dimensions in millimetres unless otherwise stated.
7. Dimensions subject to change without notice.

End of Travel Proximity Sensors Sensor Kit

- Inductive Proximity Sensors as standard, others available on request.
- No contact so no wearing parts.
- 2 wire sensor for either Normally Closed (NC) or Normally Open (NO) switching.
- Sensor has rugged one-piece metal housing.
- Optical setting aid with 2 LED colour settings:- Red LED indicates just in sensing range. Yellow LED only indicates within 80% safe sensing range.
- M12 plug in connection for fast change-ability.
- M12 sockets available straight or angled with 5-m cable (other cable lengths available on request).
- Full 360° visibility for switching with 4 yellow LED's at 90° offset.
- Sensor kit includes - sensor, mounting ring, target ring and modification to screw jacks cover pipe.

Note

- All dimensions in mm unless otherwise stated.

End of Travel Electro-Mechanical Switches

The screw jacks can be fitted with electro-mechanical limit switches in a similar design. For dimensions please consult Power Jacks Ltd.

Rotary limit switches can be used as end of travel limit switches, with the option of intermediate switches as well. These units are mounted onto a screw jacks free worm shaft and offer an alternative where bottom pipe mounted limit switches are not possible e.g. rotating screw jacks. Up to 8 limit switches can be accommodated in one enclosure (IP66). Operating temperature -40°C to +80°C.

More RLS-51 rotary limit switch details in System Components section of design guide

Note

- More than 8 contacts on request.
- Dimensions with more than 8 contacts and with special executions, eg. potentiometer, on request.
- RLS-51 B5 Flange thickness = 4mm.
- Options available include Anti-condensation heaters, potentiometer, pulse transmitter, encoder, aluminium housing and VBG-70 STAGE technology.
- Mounting kits available for all screw jacks. For those not listed, consult Power Jacks.

Special Designs

OUR SCREW JACK DESIGNS ARE FULLY CUSTOMISABLE BY OUR ENGINEERING TEAM SO YOUR APPLICATION CAN BE THE BEST.

Customised Products

For Power Jacks, every order is different.

We're ready every time to assess the precise requirements of the customer and formulate the right solution.

Off-the-shelf solutions are the norm for many engineering companies. And while they're certainly options for our customers, that's only the case if they're precisely the right options.

We pride ourselves on our adaptability – on our readiness to customise basic models, or even to start from scratch, so that we're providing products that offer optimum performance.

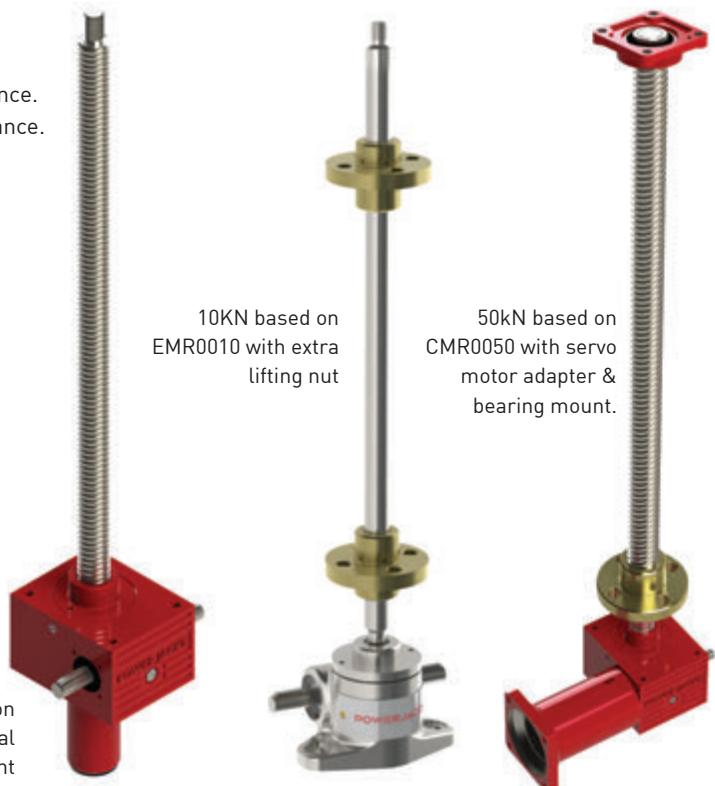

It's a customising service across our entire range of products that means customers get exactly what they need.

Special screw jack design are divided into 4 categories:

1. E-Class - simple customisation
2. SE-Class - enhanced design for specific performance.
3. HSE-Class - highly enhanced design for specialised performance.
4. XSD - extreme special designs for highly specialised performance.

E Class Special Design

Enhances screw jack design by making simple customisation and feature additions. Examples include (but not limited to): Non-Standard Paint, Non-Standard Plating, Non-Standard Lubrication, Non-Standard Seals, Non-Standard Motor Adapter, Plating of Screw Jack Gearbox Housing, 3-Start Thread on Lifting Screw for increased lead, Special Closed Height for Screw Jack, Extended Worm Shaft, etc..

SE Class Special Design

Special Enhancements to screw jack designs where new parts and/or accessories are used to deliver the best performance for the application. Examples include (but not limited to): Integration of Brake to Screw Jack Body, Bespoke End Fitting on Lifting Screw, Lifting Nut with Square Flange, Non-Standard Worm Shaft Design, Cover Pipes on Rotating Screw Jack, etc.

HSE Class Special Design

High Specification Enhancements to screw jack design where significant changes are made to main screw jack design and/or new and/or specialised accessories are integrated. Examples include (but not limited to): Bespoke Clutch on Worm Shaft, Coil Spring Load Limiter, Centre of Gravity Balanced Designs, Bespoke Trunnion Mounts, Telescopic Lifting Screw, Lifting Screw with Left & Right Threaded Sections, Increased Base Thickness for Screw Jack Gearbox Housing etc..

2000kN Based on EMT2000 with bespoke clutches for drives, geared motor integration, monitoring sensors, centre of gravity counter balance and bellows boot.

50kN based on EMT0050 complete stainless steel subsea screw jack with bespoke ROV interface.

200kN based on EMT0200 with bespoke trunnion mount, integrated motor and RLS-51 limit switches, customised fork end and bellows boot.

XSD Class Special Design

eXtreme Special Design for screw jacks where a modification of our existing range is not practical for engineering and/or commercial goals. The way to get the best performance for the application is to design and manufacture a unique product using our state of the art screw jack technology. Examples include (but not limited to): Seismic Rated 3500kN Nuclear Screw Jacks, Large Valve Control Mechanisms, 200degC rated Screw Jacks, Ultra Light Weight Screw Jacks for mobile applications, Solar Tracking Screw Jacks

3500kN Seismic rated Nuclear Screw Jacks complete special design for translating and rotating machine screw jacks.

U-Series Underwater / Subsea Screw Jack Overview

The U-Series subsea screw jacks are a proven and reliable technology for subsea lifting, positioning and actuation solutions down to a depth of 3000m. They are used in a wide variety of underwater applications in the oil & gas sector. Each submersible variant is tailored exactly to the customer application.

Rotating Screw, Upright

Rotating Screw, Inverted

Translating Screw, Upright

Translating Screw, Inverted

- Proven depth ratings up to 3000m subsea as standard (deeper on request)
- Pressure compensated or flooded designs available
- Capacities up to 2000 kN (200Te) as standard
- Capacities up to 35000 kN (3500Te) on request
- Machine Screw Jacks
- Translating and rotating screw configurations
- Full stainless steel Screw Jacks
- Self-locking (the products only use power when moving)
- Anti-rotation mechanism for unconstrained loads
- Anti-backlash mechanism for axial positioning
- Option for reinforced shaft design for up to 300% higher torque transmission

- Reinforced sealing
- Dual nut (safety nut) fail safe load-holding option
- Shock load rated units
- Full range of anti-corrosion options
- ROV drive interfaces
- Low (-65°C) to High (+250°C) temperature solutions available
- Vibration resistant designs
- Full range of feedback devices for speed, position, rotation, wear and load monitoring control
- Special custom designs available to meet your exact requirements

U-Series Screw Jacks can be connected together in jacking systems so that multiple units can be operated and controlled together.

For more details request the U-Series brochure from Power Jacks or download a copy from www.powerjacks.com

U-Series Subsea Screw Jack Performance

Full Stainless Steel Construction

Model		UM-0025	UM-0050	UM-0100	UM-0200	UM-0300	UM-0500	UM-1000	UM-1500	UM-2000

Available on Request

Notes:

- All metric machine screws have a trapezoidal thread form, single start as standard (diameter x pitch)
- For loads of 25% to 100% of Screw Jack capacity, torque requirements are approximately proportional to the load
- Efficiency values for standard grease lubricated worm gear box and lifting screw
- For performance of anti-backlash and anti-rotation (keyed) models, consult our Power Jacks experts

Standard construction:

- Stainless steel Screw Jack rated for rated capacity in tension or compression for static or dynamic movement
- Lubrication = EP2 Grease
- Paint finish = Power Jacks Standard Subsea Yellow (other colours available on request)
- Other materials, plating and paint specifications are available to suit all applications and budgets

Please supply depth rating required with enquiry

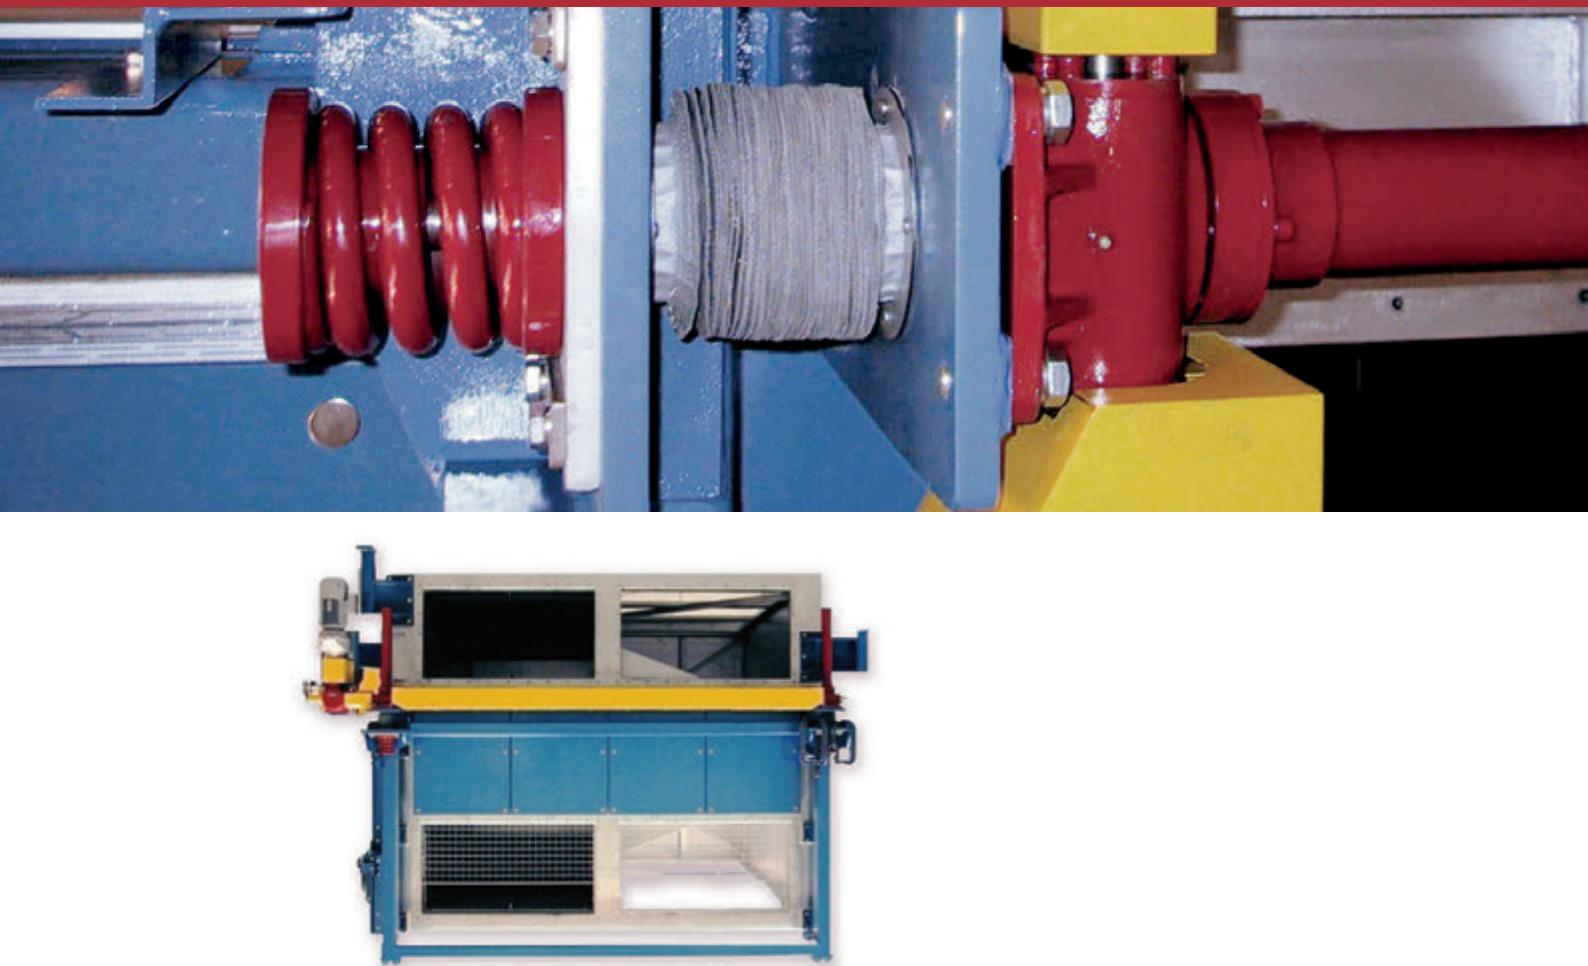

GRAPHITE HANDLING MACHINE

The Graphite Handling system was developed to retrieve graphite components, capping pieces and thermocouples from inside nuclear reactors, crush them for size reduction and deposit them into shielded flasks. The machine houses 4 types of flask.

The Crusher Jaws are driven by three 50 kN E-Series Ball Screw Jacks, complete with Bevel gearbox, brake and motor, to size reduce the component. The selected Flask is raised into the docking position by two more 50kN screw jacks, driven by a single electric motor via bevel gearboxes. The size reduced component is deposited into the flask and the flask is returned to its storage position.

For more application examples see the 'Power at Work' brochure or www.powerjacks.com.

COIL SPRING LOAD LIMITER

When an industrial machine needs to move a cover or lid onto a dead stop or sealing face it must do so precisely and positively, with contact on all dead stops or over the complete sealing face.

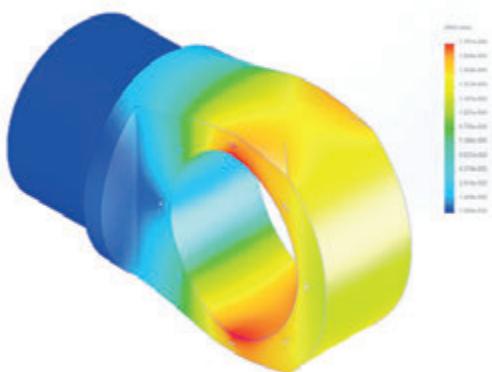

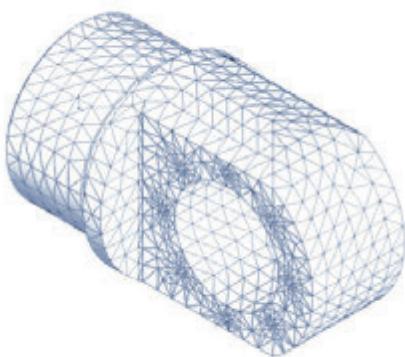

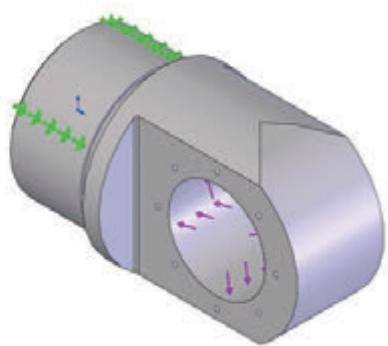

To push the cover into position precisely Power Jacks designed a special coil spring load limiter for the end of the jacks lifting screw.

For more application examples see the 'Power at Work' brochure or www.powerjacks.com.

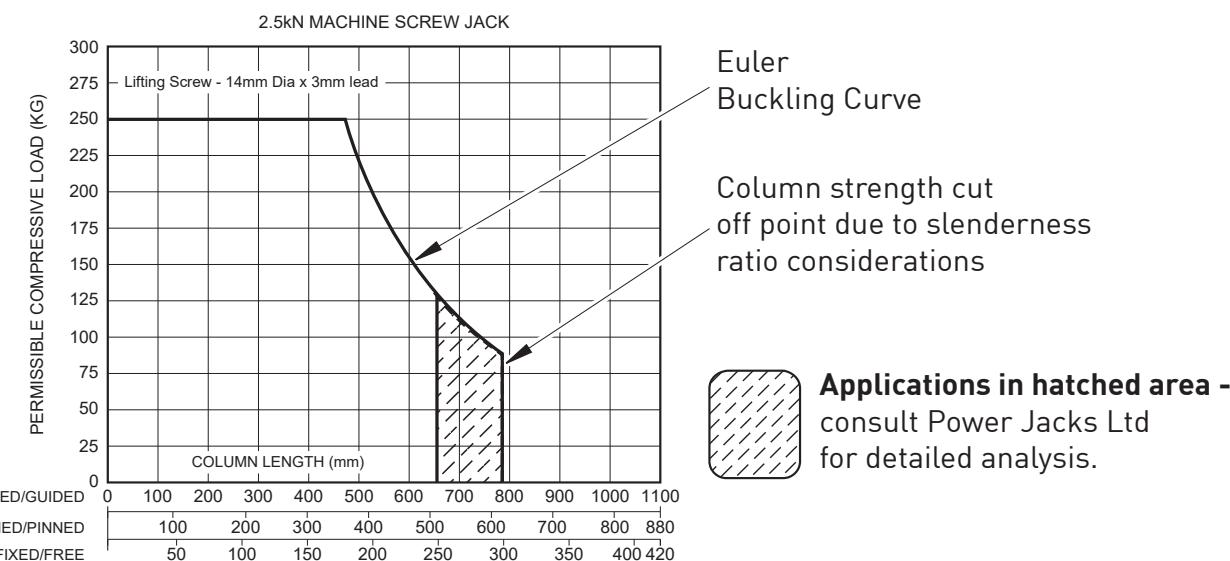

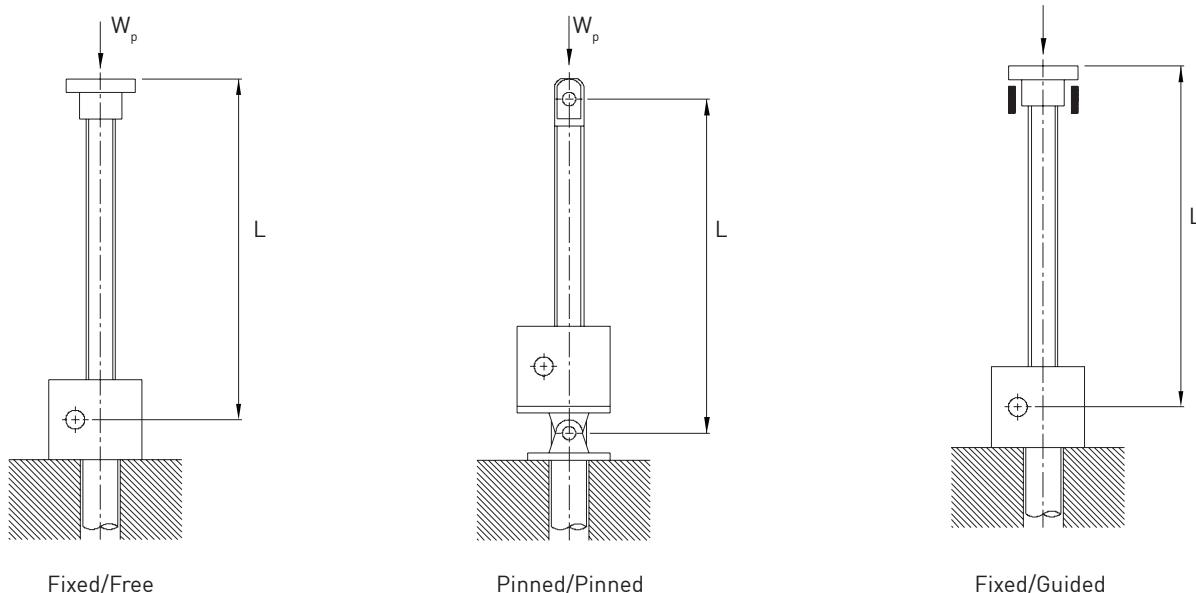

ENGINEERING GUIDE

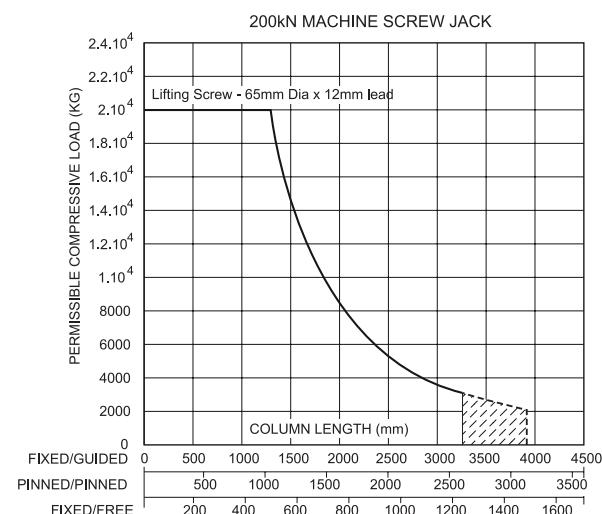

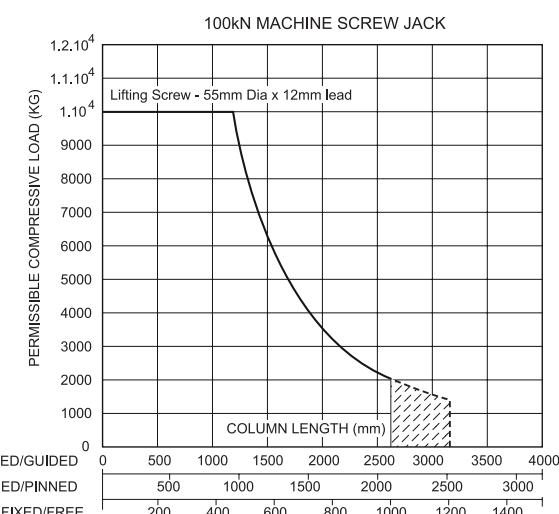

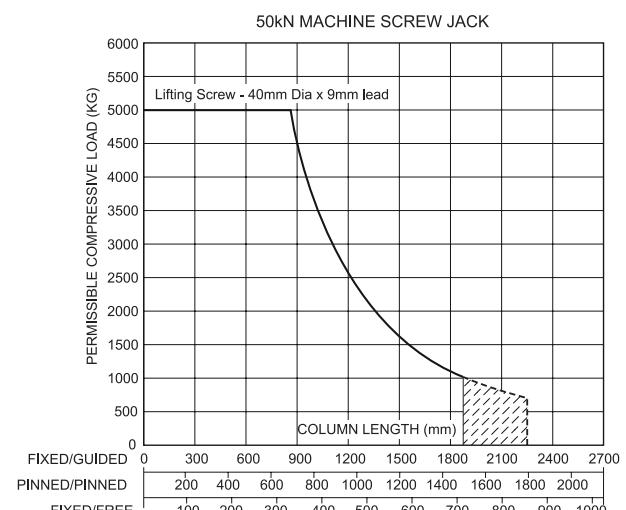

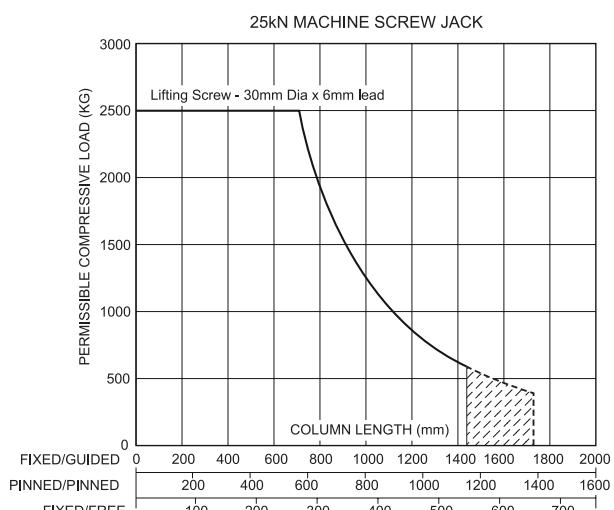

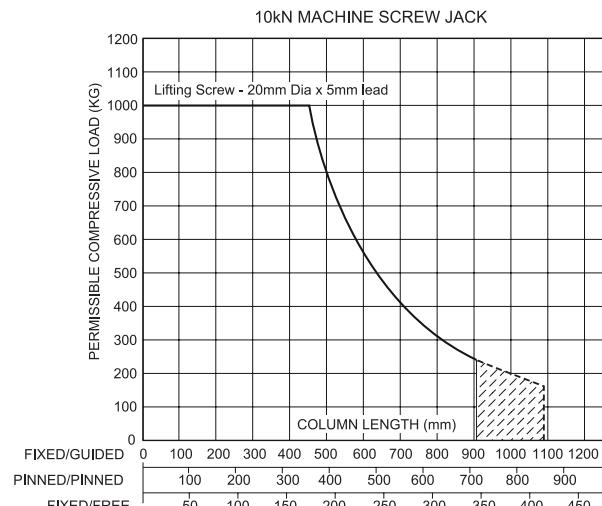

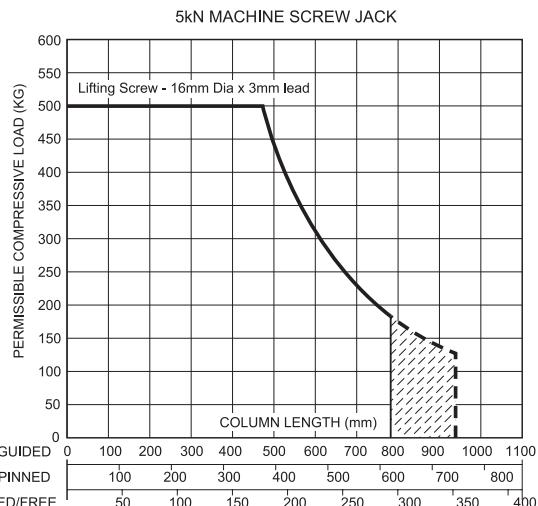

USEFUL PERFORMANCE & OPERATIONAL DETAIL FOR SCREW JACKS

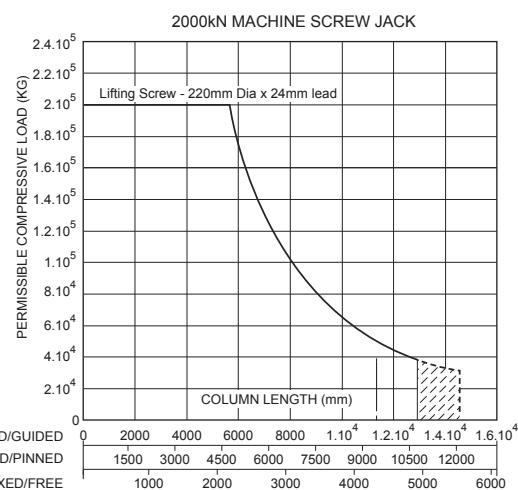

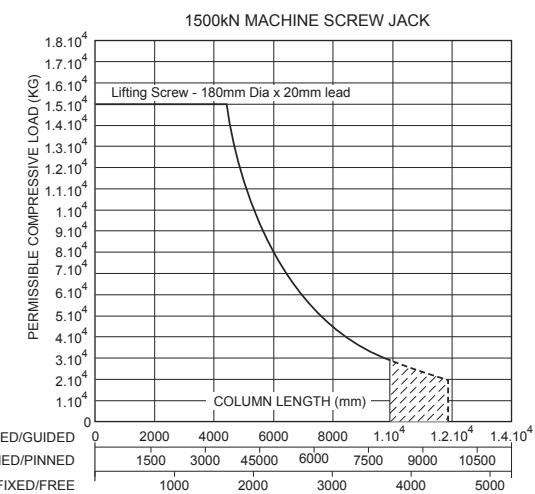

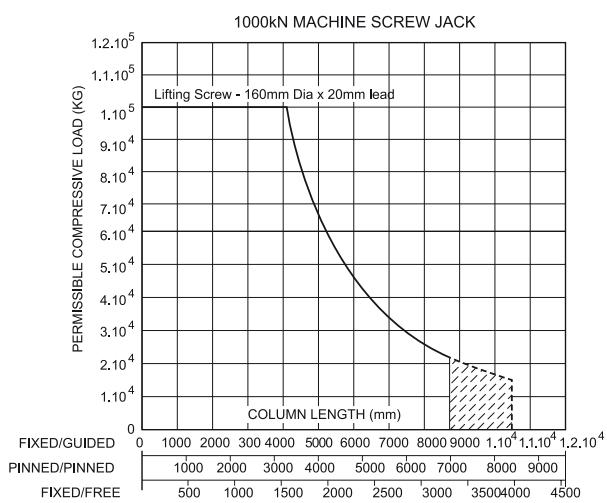

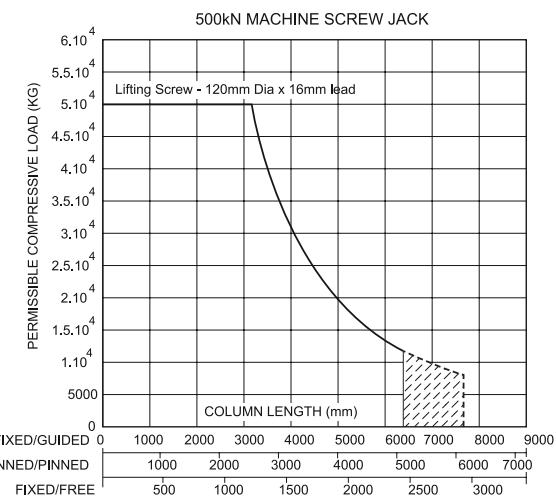

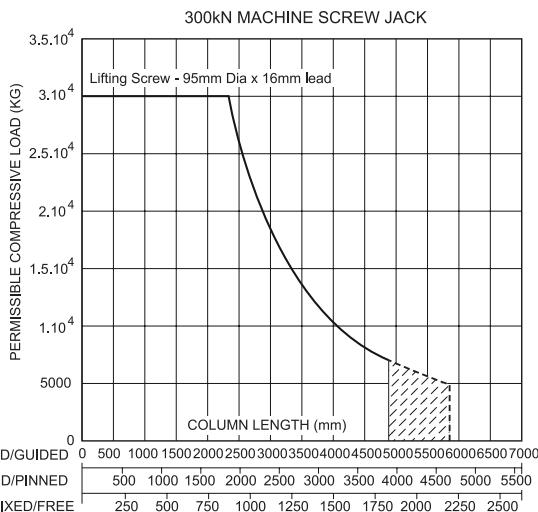

Important Notes

1. All charts are rated for industrial cargo with a safety factor of 3.5.
2. For human cargo a safety factor of 5 is recommended. To alter the permissible compressive load (W_p) for human cargo multiply the load selected from the chart by 0.7 e.g. $W_{PHC} = W_p * 0.7$.

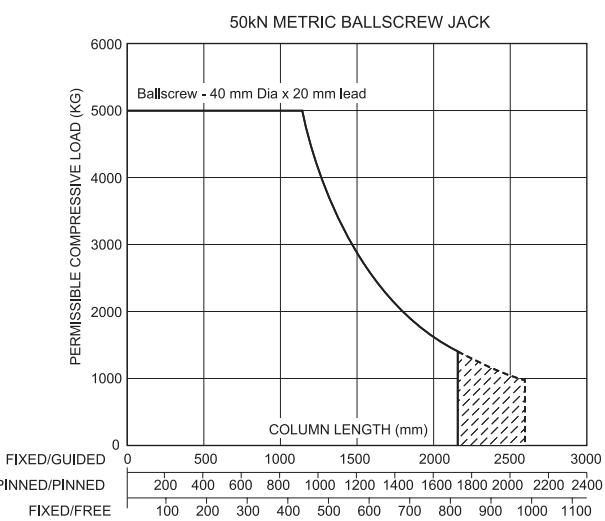

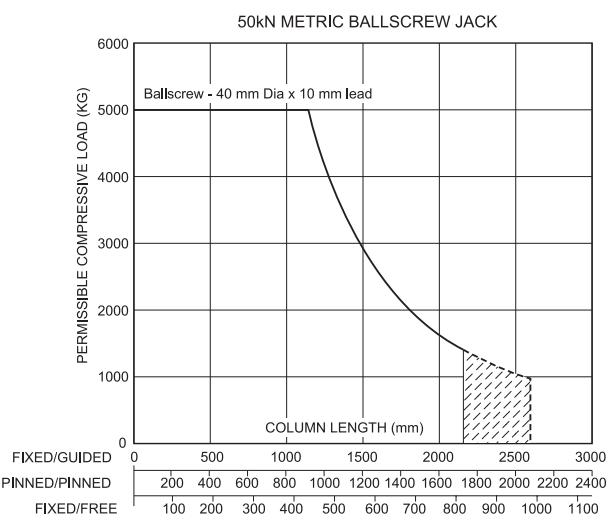

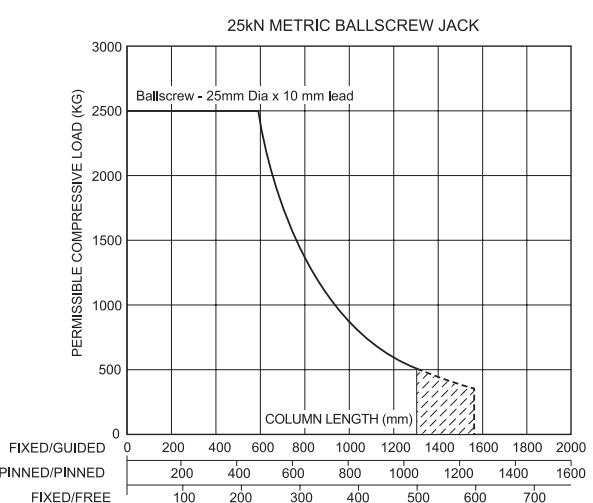

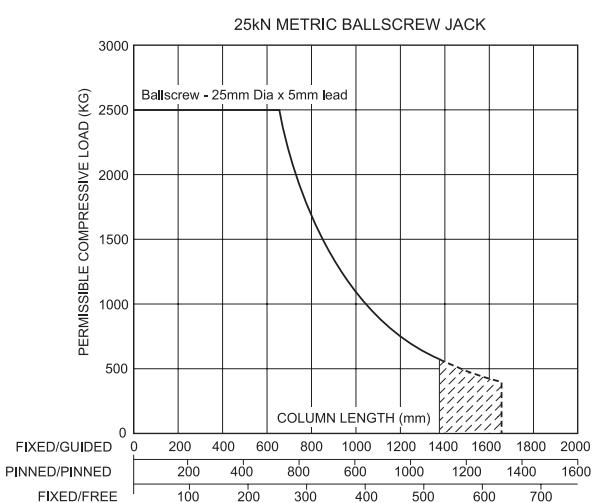

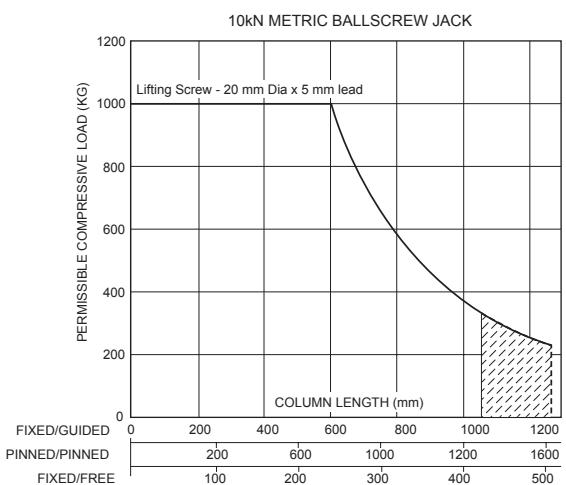

Column Length Correction Factors, F_{cb} 

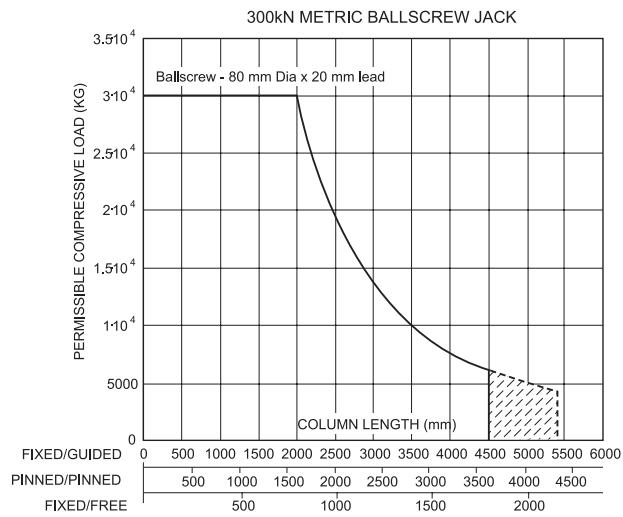

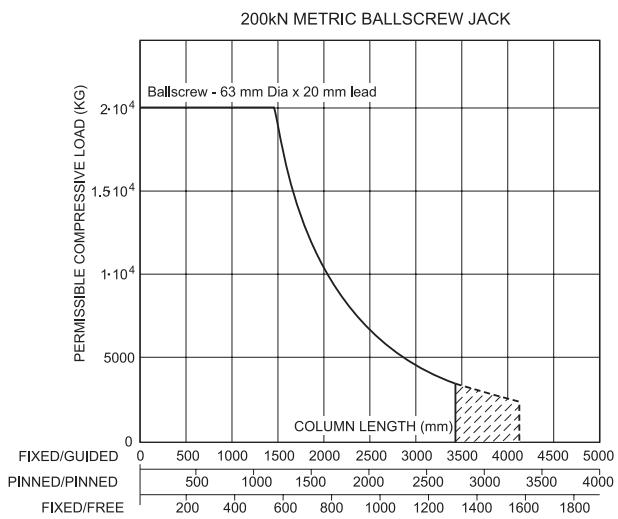

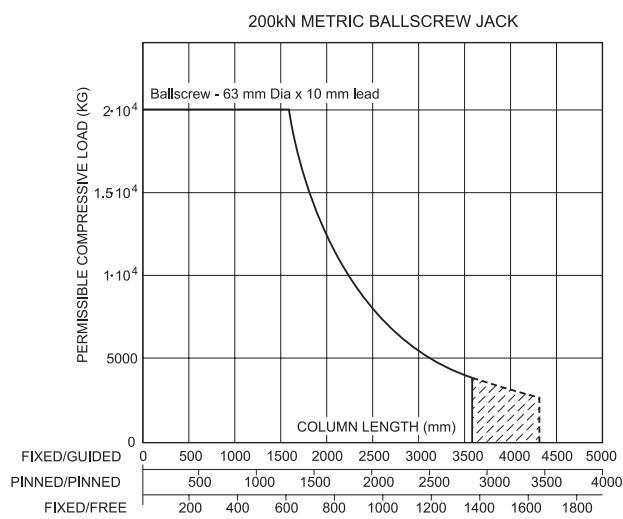

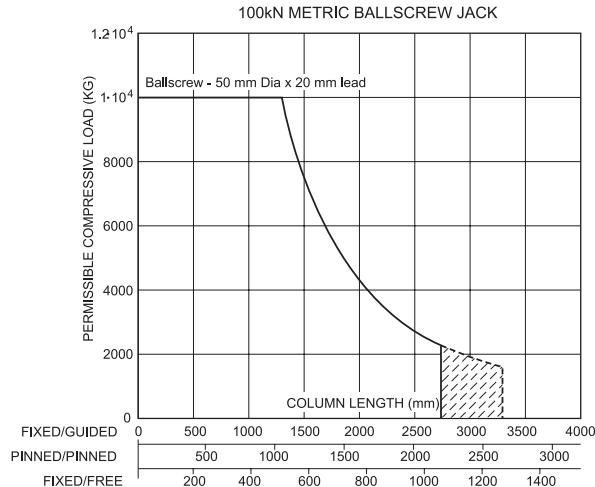

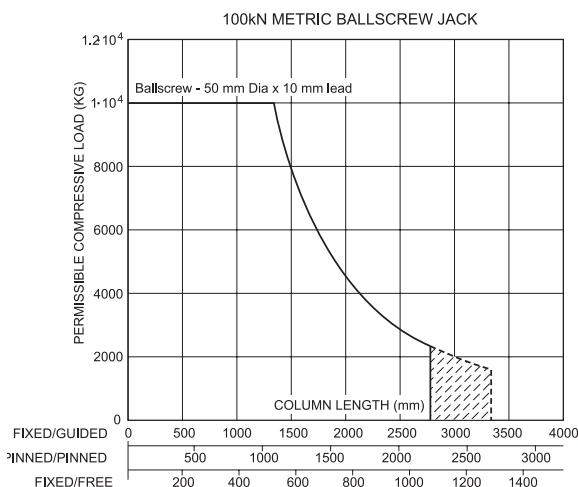

**Note**

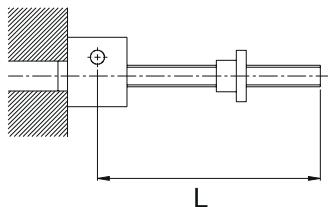

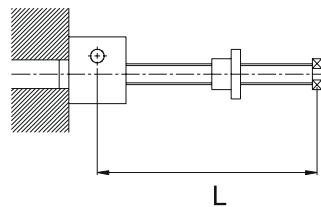

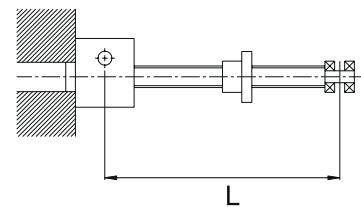

1. Column end constraints based on A.I.S.C. recommended values
2. All screw jack column strength charts show a Euler buckling curve and three scales for the appropriator end condition for the application under analysis.

**Note**

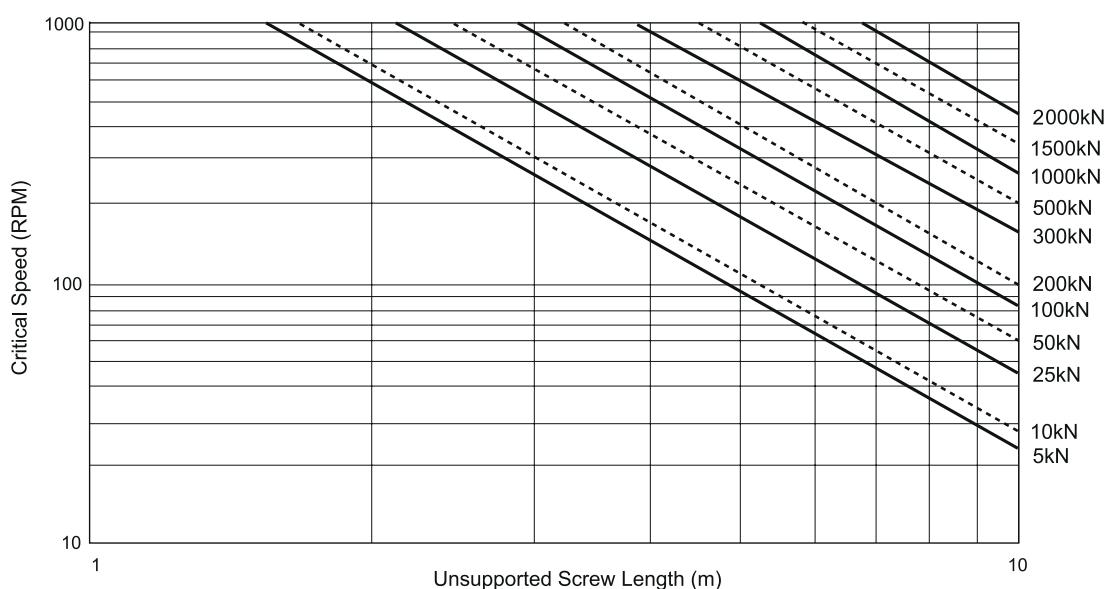

1. Column end constraints based on A.I.S.C. recommended values
2. All screw jack column strength charts show a Euler buckling curve and three scales for the appropriate end condition for the application under analysis.

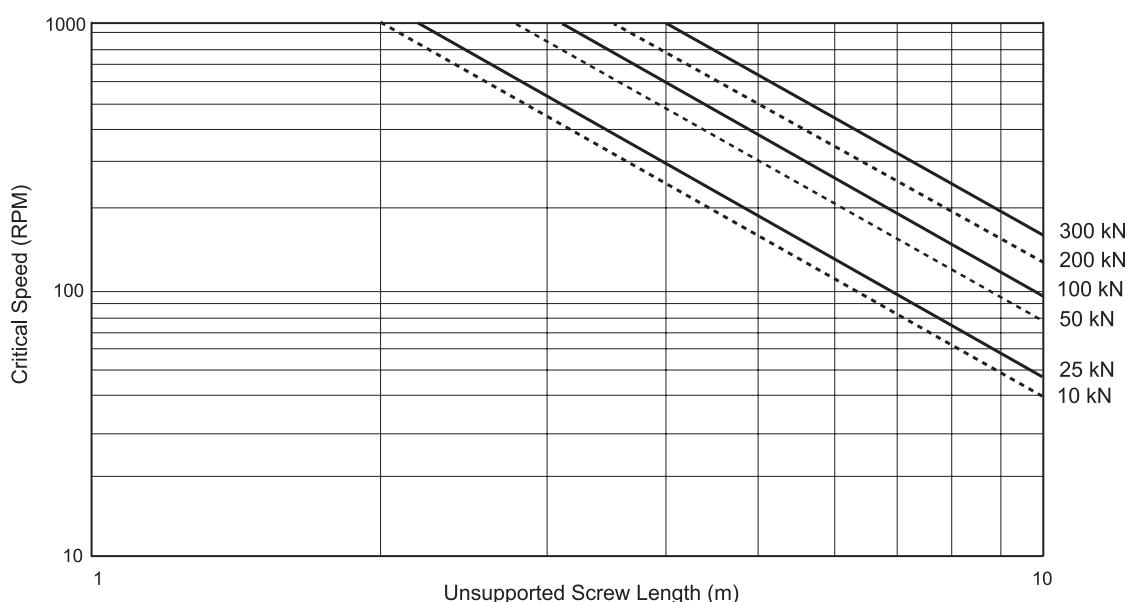

Critical Screw Speed Factors, F_{cs} Fixed/Free, $F_{cs} = 0.15$ Fixed/Supported, $F_{cs} = 0.7$ Fixed/Fixed, $F_{cs} = 1$ 

Machine Screw Critical Screw Speed (Shaft Whirling)

Based on both ends fixed and 80% of the critical speed.

Ball Screw Critical Screw Speed (Shaft Whirling)

Based on both ends fixed and 80% of the critical speed.

The key torque (restraining torque) is caused by the tendency of the lifting screw to rotate. It is a function of the screw lead, screw efficiency and the load. It is not affected by the screw jack unit gear ratio.

Note

The values below are given at rated load. For a smaller load reduce the key torque in direct proportion.

Machine Screw Jacks

Capacity (kN)	Screw Diam (mm)	Lead (mm)	Key Torque (Nm)
5	16	0.003	8
5	16	0.006	11
10	20	0.005	22

Maximum Jack Side Load Ratings with Full Jack Rated Load in Tension

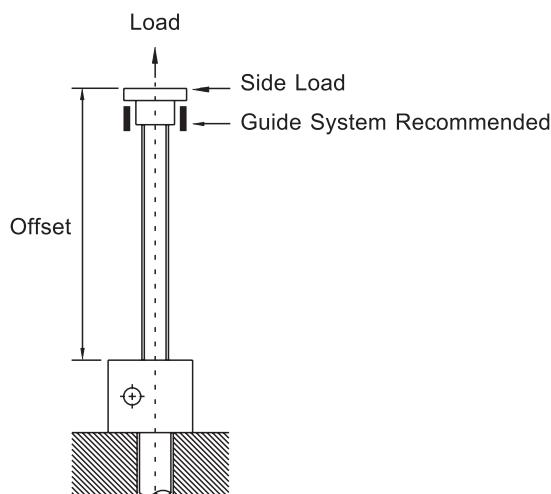

Machine Screw Jacks

Metric Machine Screw Jack									
Capacity (kN)	5	10	25	50	100	200	300	500	1000
Max. Side Load 300mm Offset (N)	100	150	540	1130	2900	3350	17500	37800	83400

Ball Screw Jacks

Ball Screw Jack									
Capacity (kN)	10	25	25	50	50	100	100	200	200
Ball Screw Lead (mm)	5	5	10	10	20	10	20	10	20
Max. Side Load 300mm Offset (N)	105	195	195	980	980	1570	1570	2060	4340

*Consult Power Jacks.

To calculate maximum side load for different raises for screw jacks in tension under full rated load use the following formula to modify the above tabulated values.

$$\text{Permissible Max. Side Load for Actual Offset} = \frac{\text{Max Side Load Rating Tabulated} \times \text{Stated Offset}}{\text{Actual Offset}}$$

Note

The correct units must be used

Important Notes

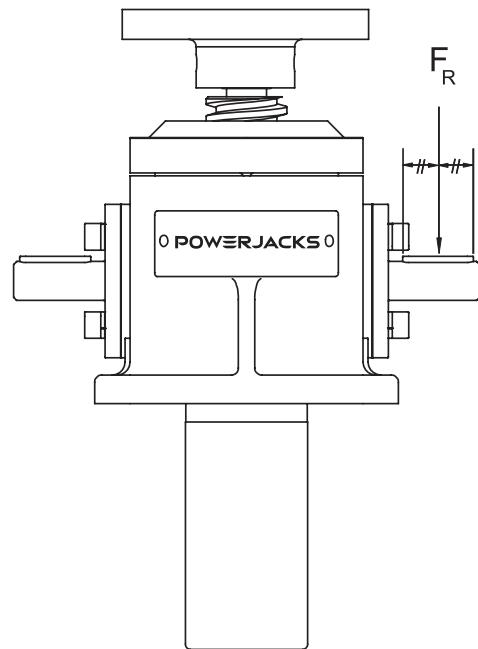

1. These figures are for Screw Jacks in tension only.
2. The figures given above are permissible side load ratings, however, we recommend that all side loads be carried by guides in your arrangement and not by the screw and nut.
3. Life of the lifting screw and nut will be adversely affected the more side load they see.
4. These figures are based on acceptable stresses in the lifting screw and not on lifting screw deflection.
5. For maximum side load ratings for screw jacks in compression consult Power Jacks Ltd.
6. For precise calculations for your application consult Power Jacks Ltd.

For applications where a screw jack is belt/chain driven, a calculation must be made to determine the radial force (F_R) and compared to the allowable radial load exerted on the worm shaft, that must not exceed those tabulated below. The values below are maximum values for the screw jacks at rated load regardless of worm speed or load direction and the radial load applied midway along the key of the worm shaft. For all applications the sprocket, gear etc. Should be positioned as close as possible to the screw jack housing in order to reduce bearing loads and shaft stresses and to prolong life.

$$\text{Radial Force, } F_R = \frac{2000 \times T \times K}{D}$$

Where F_R = Radial Load (N)
 T = Torque applied to the screw jacks input shaft (Nm)
 K = Factor from table below
 D = PCD in mm of gear, sprocket

Transmission Element	Factor K
Chain sprocket	1
Gears (spur or helical pinion)	1.25
V-Belt pulley	1.5
Flatbelt pulley	2.0

Ball Screw Jack				
Capacity (kN)	25	50	100	200
Radial Load (N)	440	1100	1200	1600

Machine Screw Jack									
Capacity (kN)	5	10	25	50	100	200	300	500	1000
Radial Load (N)	180	325	380	740	1000	1600	2170	2190	2220

Machine Screw Jacks

Component	Normal Backlash
Lifting Screw and Nut	0.12mm → 0.2mm (0.005" → 0.008")
Load Bearings	0.00mm → 0.03mm (0.000" → 0.001")
Total	0.12mm → 0.23mm (0.005" → 0.009")

Note

1. The lifting screw backlash will increase during operation due to wear of threads in the nut
2. Axial play can be reduced by altering the load bearings preload to eliminate bearing play or by specifying a screw jack with the Anti-Backlash feature
3. For exact backlash ratings for an individual unit consult Power Jacks.

Anti-Backlash Option

Machine screw jacks fitted with the anti-backlash feature can be adjusted for screw thread and bearing clearances to a minimum of 0.025 mm (0.001"). Some clearances must be maintained to keep torque requirements within reason and to provide adequate space for a lubrication film to form.

Ball Screw Jacks

Component	Normal Backlash
Ball Track and Nut	0.05mm → 0.15mm (0.002" → 0.006")
Load Bearings	0.00mm → 0.03mm (0.000" → 0.003")
Total	0.05mm → 0.18mm (0.0002" → 0.007")

Note

1. For exact backlash ratings for an individual unit consult Power Jacks.
2. Ball nuts can be supplied with zero backlash or with adjustable backlash via a special twin nut assembly (twin nut assembly for rotating screw units only). Consult Power Jacks for details.
3. Altering the load bearings preload to eliminate bearing play can reduce axial play.
4. There is no Anti-Backlash nut feature for the gear sets of these screw jacks.

Pitch Deviation of Lifting Screw

Lifting Screw	Pitch Deviation
Machine Screw	0.05mm → 0.25mm per 300mm
Ball Screw	0.025mm → 0.050mm per 300mm (DIN Class 5.7)

Note

1. Pitch deviation is cumulative and **NOT** detrimental to the operation of the Screw Jack
2. The Lifting screws are manufactured from material with a straightness tolerance of 0.2 mm per metre
3. Pitch deviation is related to the cutting machines tolerance and the material used.

Machine Screw Jacks

Stroke (mm)	5kN	10kN	25kN	50kN	100kN	200kN	300kN	500kN	1000kN
100	0.7	0.6	0.8	1.0	1.0	0.4	0.4	0.7	0.7
200	1.3	1.1	1.4	1.7	1.7	0.7	0.6	1.0	1.0
300	1.9	1.5	1.9	2.3	2.3	0.9	0.8	1.3	1.3
400	2.5	2.0	2.5	2.9	2.9	1.2	1.0	1.7	1.6
500	3.1	2.4	3.1	3.6	3.6	1.4	1.2	2.0	1.9
600	3.7	2.8	3.6	4.2	4.2	1.6	1.4	2.3	2.2
700	4.3	3.3	4.2	4.8	4.8	1.9	1.6	2.6	2.4
800	4.8	3.7	4.8	5.5	5.5	2.1	1.8	2.9	2.7
900	5.4	4.2	5.3	6.1	6.1	2.4	1.9	3.2	3.0
1000	6.0	4.6	5.9	6.7	6.7	2.6	2.1	3.6	3.3

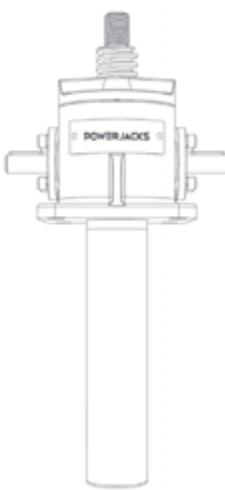

Notes

1. Values quoted above are the maximum expected lateral movement for the given raise and screw jack model.
2. Does not allow for possible deflection due to side loads.
3. Lateral movements are for information only. For best results we recommend guides where possible.
4. Lateral movements will be reduced if the screw jack is fitted with secondary guides.
5. The above movements apply to machine screw jack only and not ball screw jacks. Permitting lateral movement on the ball screw jack under load will exert side thrust on the ball screw and ball nut and will be detrimental to the ball screw and nut life. Ball screw applications should be guided to ensure a minimum of lateral movement.
6. Where lateral movement is critical consult Power Jacks for exact values for the application.

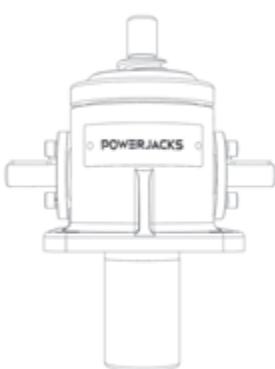

How a Rotating Screw Jack Works

The rotation of the worm shaft causes the worm gear to rotate. For rotating screw jacks the lead screw is fixed to the worm gear and they rotate at the same speed. The lifting nut moves along the lead screw. As the worm gear turns, the friction forces on the screw thread act to turn the nut also. The greater the load on the screw jack unit, the greater the tendency of the nut to turn. If the nut turns with the screw, it will not raise the load. Therefore the nut needs to be fixed to a structure to prevent rotation. The restraining torque required for the structure, also known as the "lead screw key torque" can be found on the product performance tables in this catalogue or requested from Power Jacks.

How a Translating Screw Jack Works

The rotation of the worm shaft causes the worm gear to rotate. For translating screw jacks the worm gear is threaded to accommodate the lead screw thread. The lead screw translates through the gear. As the worm gear turns, the friction forces on the screw thread act to turn the screw also. The greater the load on the screw jack unit, the greater the tendency of the screw to turn. If the screw turns with the nut (worm gear), it will not raise the load. In those cases where a single unit is used, and where the load cannot be restrained from turning, it is necessary to use a screw jack with an anti-rotation mechanism (keyed screw jack). Lead screw key torque (refer to the product performance tables in this catalogue or request from Power Jacks) must be checked as excessively heavy unguided loads could break the Anti-rotation mechanism (key).

Anti-Backlash Screw Jack – When To Use

For reduced axial backlash of the lead screw in the screw jack select a model with the "Anti-Backlash" mechanism. This is typically used when the load direction changes from tension to compression and minimal axial backlash is required. This design is only available for translating screw jacks. It can be combined with Anti-Rotation mechanism as well.

Input Torque Required for a Screw Jack

The input torque for a single screw jack depends on the load, the worm gear ratio, type of screw (machine screw, ball screw or roller screw) and the pitch of the lead screw. Torque values are listed in the individual product specification charts based on capacity loads. For loads from 25% to 100% of screw jack model capacity, torque requirements are approximately proportional to the load.

Note

The input torque, as well as the efficiency and side load ratings, is the same for both translating screw and rotating screw jacks.

Maximum Input Power & Speed for a Screw Jack

The input power to the screw jacks should not exceed the power rating shown in the specifications table. Maximum input speed in rpm (revolutions per minute) to a screw jacks worm shaft should not exceed 1800 rpm for C & E-Series screw jacks.

Efficiency of a Screw Jack

Screw Jack model efficiencies are listed in the individual product specification charts.

Expected Life of a Screw Jack

The life expectancy of a screw jacks lead screw, bearings, nut and worm gear set varies considerably due to the extent of lubrication, abrasive or chemical action, overloading, excessive heat, improper maintenance, etc. For detailed life calculations, consult Power Jacks.

Screw Jack with Anti-Rotation [Keyed] Mechanism

This design is only available for translating screw jacks. If the structure/object connected to the lead screw is not prevented from rotating or the lead screw is not always in contact with the structure then a screw jack with an "Anti-Rotation" mechanism [keyed] should be used.

Standard Screw Jacks - How To Prevent The Load from Rotating

For multiple screw jack systems, fix the lead screw end fittings (e.g. top plate or clevis) to the common member being lifted by all the units. For single screw jack applications, bolt the lead screw end fitting (e.g. top plate or clevis) to the load and ensure the load is guided to prevent rotation.

A guided load is always recommended to ensure that the screw jack does not receive any side load and so guidance can be scaled suitably for the load without altering the screw jack design unnecessarily. Note that an external guidance system can provide a higher restraining "key" torque than compared to an anti-rotation mechanism in a screw jack.

Self-Locking of Screw Jacks

Screw Jacks with 24:1 or higher gear ratios are considered self-locking in most cases. Consult Power Jacks for a recommendation specific to your application.

All screw jacks with multi-start lifting screws are considered not to be self-locking.

All ball screw and roller screw jacks are considered not to be self-locking.

Screw Jacks considered not self-locking will require a brake or other holding device.

Shock Loads on a Screw Jack

Shock loads should be eliminated or reduced to a minimum, if they cannot be avoided, the screw jack model selected should be rated at twice the required static load.

For severe shock load applications, the load bearings can be replaced with heat-treated steel thrust rings which is an option available from Power Jacks. Note this will increase the input torque by approximately 100%.

Axial Backlash in a Screw Jack

Backlash in Standard Machine Screw Jacks

Machine screw jacks have backlash due not only to normal manufacturing tolerances, but to the fact that there must be some clearances to prevent binding and galling when the screw jack unit is under load. Usually, the axial backlash is not a problem unless the load on the screw jack unit changes between compression and tension. If a problem does exist, a unit with the anti-backlash feature should be considered.

Screw Jacks with the Anti-Backlash Device

The anti-backlash device reduces the axial backlash between the lead screw and nut assembly to a regulated minimum. As the backlash will increase as the lead screw thread on the gear wears the anti-backlash device can be adjusted to remove this normal condition.

How the Anti-Backlash Device Works

When the screw (1) is under a compression load, the bottom of its thread surfaces are supported by the top thread surfaces of the worm gear (2) at point (A). The anti-backlash nut (3), being pinned to the worm gear and floating on these pins and being adjusted downward by the shell cap, forces its bottom thread surfaces against the upper thread surfaces of the lifting screw at point (B). Thus, backlash between worm gear threads is reduced to a regulated minimum.

When wear occurs in the worm gear threads and on the load carrying surfaces of the lifting screw thread, the load carrying thickness of the worm gear thread will be reduced. This wear will create a gap at point (B) and provide backlash equal to the wear on the threads.

Under compression load, the lifting screw will no longer be in contact with the lower thread surface of the anti-backlash nut. Under this condition, backlash will be present when a tension load is applied. The anti-backlash feature can be maintained simply by adjusting the shell cap until the desired amount of backlash is achieved.

To avoid binding and excessive wear do not adjust lifting screw backlash to less than 0.025mm (0.001"). This will reduce the calculated separation (C) between the anti-backlash nut and worm gear and will reduce the backlash between the worm gear threads and the lifting screw to the desired minimum value.

When separation (C) has been reduced to zero, wear has taken place. Replace the worm gear (2) at this point. This feature acts as a built in safety device which can be used to provide wear indication for critical applications.

Column Strength of the Screw Jack

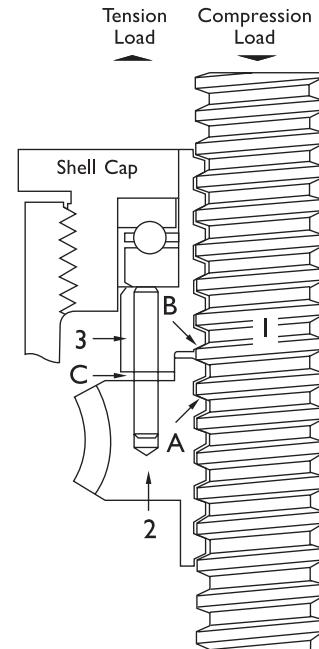

Column strength of a screw is determined by the relationship between the screw length and its diameter. For column strength charts consult product literature or Power Jacks.

Side Loads on a Screw Jack

Screw jacks are designed primarily to move and position loads and any side loads (loads not acting axially on lead screw) should be avoided. The units will withstand some side loads, depending on the diameter of the lifting screw and the extended length of the lifting screw. Where side loads are present, the loads should be guided and the guides, rather than the screw jacks, should take the side loads - particularly when long raises are involved. Even a small side load can exert great force on the housings and bearings and increase the operating torque and reduce the life expectancy.

Allowable Duty Cycle of Screw Jack

Because of the efficiency of conventional worm gear screw jacks, the duty cycle is intermittent at rated load. At reduced loading, the duty cycle may be increased. Ball screw jacks are more efficient than machine screw jacks and so can provide a higher duty cycle. In addition Power Jacks have special designs for high duty cycle screw jacks. For detailed analysis consult Power Jacks Ltd.

Maximum Operating Temperatures For E-Series Screw Jack

Normal operation at ambient temperatures of up to 90°C. Operations above 90°C will require special lubricants. For temperatures above 90°C, the life of even special lubricants is limited. Therefore consult Power Jacks on your application. For temperatures above 90°C, advise Power Jacks of full particulars of the duration of such temperatures. Power Jacks suggest that a lubricant manufacturer be consulted for type of grease and lubrication schedule. As a general rule, the screw jack unit should be shielded to keep ambient temperatures to 90°C or less.

Minimum Temperature For E-Series Screw Jacks

With the standard lubricant and materials of construction, the screw jacks are suitable for use at sustained temperatures of -20°C. Below -20°C, low temperature lubricant should be used and no shock loads are present. Power Jacks application engineers must be consulted in these instances for a recommendation. Screw Jacks with standard material of construction and lubrication may be safely stored at temperatures as low as -55°C.

Thermal / Heat Build-Up in a Screw Jack as it is operated

The duty cycle, the length of the screw, the magnitude of the load, and the efficiency of the screw jack all have a direct influence on the amount of heat generated within the screw jack. Long lifts can cause serious overheating. Note that Power Jacks have special designs with higher thermal capacities than conventional worm gear screw jacks (consult Power Jacks for more details).

Screw Jacks to Pivot a Load

A screw jack can be built to pivot a load by two methods:

1. Double Clevis Screw Jack

The screw jack can be furnished with a clevis at both ends (commonly referred to as a double clevis screw jack). The bottom clevis is welded to the bottom end of an extra strong cover pipe, which is fitted to the base of the screw jack. This cover pipe still performs its primary function of encasing the lifting screw in its retracted portion. The clevis ends can be replaced with other pivot options such as Fork End or Rod End.

2. Clevis - Trunnion Mounting

The screw jack is fitted with the pivot end fitting (e.g. Clevis, Fork or Rod End) on the lead screw and a trunnion mount adapter is bolted to the screw jacks base plate.

The design of the structure in which these types of screw jacks are to be used must be constructed so that screw jack can pivot at both ends. Use only direct compression or tension loads, thereby eliminating side load conditions.

Corrosion Resistant Properties

Screw Jacks can be supplied with alternative materials and/or paint specifications for high corrosive areas. These options include stainless steel, chrome plating, electro-nickel plating, epoxy paint, etc. Check the unit specification is suitable before installation.

Using Screw Jacks within a Rigid Structure or Press

Power Jacks recommend that the screw jack selected has a greater capacity than the rated capacity of the press or of the load capacity of the structure. We also recommend that a torque clutch or similar device be used to prevent overloading of the screw jack unit. Unless these precautions are taken, it is possible to overload the screw jack without realising it.

Screw Jack Drift after Drive Motor is Switched Off

The screw jack will drift after the motor drive is switched off unless a brake of sufficient capacity is used to prevent it. The amount of drift will depend upon the load on the screw jack and the inertia of the rotor in the motor.

For machine screw jacks with no load, the amount of drift will depend upon the size and speed of the motor. For example, a 1500 RPM input directly connected to a screw jack without a load will give on average 35mm to 60mm of drift; a 1000 RPM input will give about 1/2 as much drift. Note that the drift varies as the square of the velocity (RPM). The drift of the screw jacks screw can be controlled by using a magnetic brake on the motor. Variations of drift will also be seen if the motor drives the screw jack via a reduction gearbox.

Screw Jacks Operation where Vibration is Present

Screw Jacks will operate in areas with vibration, however the vibration may cause the lead screw to “creep” or “inch” under load. For applications involving slight vibration, select the higher of the worm gear ratios. If considerable vibration is present, use a motor equipped with a magnetic brake, which will prevent the screw jack from creep and/or back-driving.

Use of Screw Jacks Fitted With Emergency Stop Disc

To prevent over travel of the lead screw, a stop disc or nut can be fitted to a screw jack that is hand operated. It should not be used as a full power stop.

Use of Screw Jacks Fitted With Emergency Stop Nut

For motor driven units, it is possible for the full capacity of the screw jack or even a greater force (depending on the power of the motor) to be applied against the stop. These stops are called “full power stop nuts”. They must only be used as an emergency device and if such a condition occurs, an assessment made to discover why it happened in order to carry out preventative action. If the full power stop nut is used at full load in an emergency it might be driven into the unit jamming so tightly that it must be disassembled in order to free it.

It is recommended that external stops are fitted where possible, however they must only be used as a last resort (Note - limit switches are one possible solution to constrain screw jack movement safely - consult Power Jacks for system advice). Under ideal conditions where a slip clutch or torque limiting device is used, a stop pin or stop nut may be used - but Power Jacks should be consulted.

Screw Jack System Arrangements

Perhaps the greatest single advantage of Power Jacks screw jacks is that they can be linked together mechanically, to lift, lower, move or position in unison. Typical mechanical system arrangements link 2, 4, 6 or 8 screw jacks together and are driven by one motor. As an alternative, screw jacks can be individually driven by electric motors and with suitable feedback devices, such as encoders, be synchronised electronically by a control system.

Connecting Screw Jacks in Series

The number of screw jacks that can be connected in series is limited by input torque requirements on the first worm shaft in the line. For the C & E-Series the torque on the worm shaft of the first screw jack should not exceed 300% of its rated full load torque (this does not include the 200kN screw jacks which are rated at 150%).

Efficiency of a Multiple Screw Jack System

In addition to individual device efficiencies, the efficiency of the screw jack arrangement must be taken into consideration. The arrangement efficiency allows for misalignment due to slight deformation of the structure under load, for the losses in couplings, bearings, and for a normal amount of misalignment in positioning the screw jacks and gearboxes. For efficiency values consult Power Jacks product literature or engineers.

Number of Screw Jacks in System	2	3	4	6-8
Jacking System Efficiency	0.95	0.90	0.85	0.80

Screw Jack Fitted with 3rd Party Accessories

If your screw jack is fitted with a device not manufactured by Power Jacks then please consult the provided manual for this device.

Installation and Maintenance Tips

The following installation and maintenance tips are for the C & E-Series, Metric machine screw and ball screw jacks models. General care should be taken to ensure that equipment is sufficient to handle the load.

1. The structure on which the screw jack unit is mounted should have ample strength to carry the maximum load, and be rigid enough to prevent undue deflection or distortion of the screw jack unit supporting members.
2. It is essential that the screw jack be carefully aligned during installation so that the lifting screws are vertically true and the connecting shafts are exactly in line with the worm shafts. After the screw jack, shafting, and gear boxes are coupled together, it should be possible to turn the main drive shaft by hand. If there are no signs of binding or misalignment, the jacking system is then ready for normal operation.
3. The screw jack should have a greater stroke than is needed in the screw jack installation. If it is necessary to operate the screw jack at the extreme limits of travel, it should be done with caution.

CAUTION: Do not allow screw travel below catalogue closed height of the screw jack or serious damage to internal mechanism may result. Refer to table specifications for closed height of respective units.

4. The input power should not exceed the power rating shown in the specification table. Maximum RPM should not exceed 1800.
5. The lifting screw should not be permitted to accumulate dust and grit on the threads. If possible, lifting screws should be returned to closed position when not in use.
6. The ball screws in the ball screw jacks should be checked periodically for excessive backlash and spalling of raceways. A periodic check of backlash of the lifting screw thread is recommended to check wear of the worm gear internal threads on the machine screw jack models. Backlash in excess of 50% of the thread thickness indicates the need to replace the worm gear.
7. Unless otherwise specified, screw jacks are shipped packed with grease which should be sufficient for one month of normal operation. For normal operation, the screw jacks should be lubricated about once a month, using one of the following extreme pressure greases or their equivalent:

Shell	Gadus S2V220AC2 (Alvania WR2)
BP	Energrease LC2
Castrol	Spheerol EPL2
Mobil	Mobilux EP2

For severe conditions, the screw jacks should be lubricated more frequently, using one of the above greases (daily to weekly depending on conditions). If duty is heavy, an automatic lubrication system is strongly recommended. If ambient temperatures exceed 90°C (194°F) consult Power Jacks.

8. On ball screw jack applications, periodically lubricate the exposed ball screw grooves with a cloth dampened with a good grade 10W30 oil for most applications. An instrument grade oil should be used in dirty and heavy duty environments, and bearing grease for environments at extremely high temperatures. Extreme temperature and other environmental conditions should be referred to Power Jacks for recommended lubricating procedures.

CAUTION: Where ball screws are not protected from airborne dirt, dust, etc., bellows boots should be used. Inspect frequently at regular intervals to be certain a lubricating film is present. Ball screws should never be run dry.

9. Due to the high efficiency of the ball screw jack design, a brake must be used in conjunction with motor selected to position the screw jack.

Useful Formulae for Screw Jack Calculations

Lifting Screw Lead

Lifting Screw lead (mm) = Screw Pitch (mm) *Number of Starts on Lifting Screw

Calculation of the Linear Speed

When the worm shaft speed is known, the linear speed can be determined with this formula:

$$\text{Linear Speed (mm/min)} = \frac{\text{RPM of Worm Shaft} \times \text{Lifting Screw Lead (mm)}}{\text{Gear Ratio}}$$

or alternatively

$$\text{Linear Speed (mm/min)} = \frac{\text{RPM of Worm Shaft}}{\text{Turns of Worm for 1mm Travel}}$$

Calculation of Screw Jack Input Torque

$$\text{Input Torque (Nm)} = \frac{\text{Load (kN)} \times \text{Lifting Screw Lead (mm)}}{2 \times \pi \times \text{Efficiency} \times \text{Gear Ratio}}$$

or alternatively

$$\text{Input Torque (Nm)} = \frac{\text{Input Power (kW)} \times 9550}{\text{Input Speed (rpm)}}$$

Calculation of Screw Jack Input Power

$$\text{Input Power (kW)} = \frac{\text{Load (kN)} \times \text{Lifting Screw Lead (mm)} \times \text{Input Speed (rpm)}}{60000 \times \text{Efficiency} \times \text{Gear Ratio}}$$

or alternatively

$$\text{Input Power (kW)} = \frac{\text{Load (kN)} \times \text{Linear Speed (mm/min)}}{60000 \times \text{Efficiency}}$$

Range-N Bevel Gearboxes

**ULTRA COMPACT &
VERSATILE SPIRAL BEVEL
GEARBOXES**

Introducing the Range-N bevel gearbox range from Power Jacks, an ultra compact and versatile design.

Created by a team of experienced design engineers, the focus was to provide our customers with a ultra compact bevel gearbox that offers versatility in design. In addition to this, we wanted to design a bevel gearbox that had the perfect combination of excellent performance, a long lasting service life, durability and the flexibility to be engineered for the most demanding applications.

Perfect for industrial applications or the extreme such as subsea, defence or nuclear.

Standard Gearbox

- 6 Gearbox Sizes
35, 37, 38, 39, 40, 42 Series
- 16 Gearbox Configurations
- Gear Ratios:
1:1, 1.5:1, 2:1, 3:1 and 4:1*
*No 4:1 on Series-35
- Special gear ratios available on request
e.g. 1.25:1
- Power Ratings: 0.1 - 226 kW
- Torque Ratings: 15 Nm - 7000Nm

Gearbox Housing

A rugged Ultra Compact design made from a highly durable SG Iron. This provides a strong housing that firmly and accurately holds the gear set in a reservoir of quality lubricant suited to the most industrial demands.

Corrosion Protection

To suit all economic needs.

- Standard Industrial Paint Finish
- Arduous Environment Paint Finish
- Customer Specified Paint
- Plated Finish
- Stainless Steel

Reliable Spiral Bevel Gear

With a proven design already used in millions of gearboxes, the Precision Spiral Bevel Gears with accurate gear mesh delivers high torque with smooth and quiet transmission.

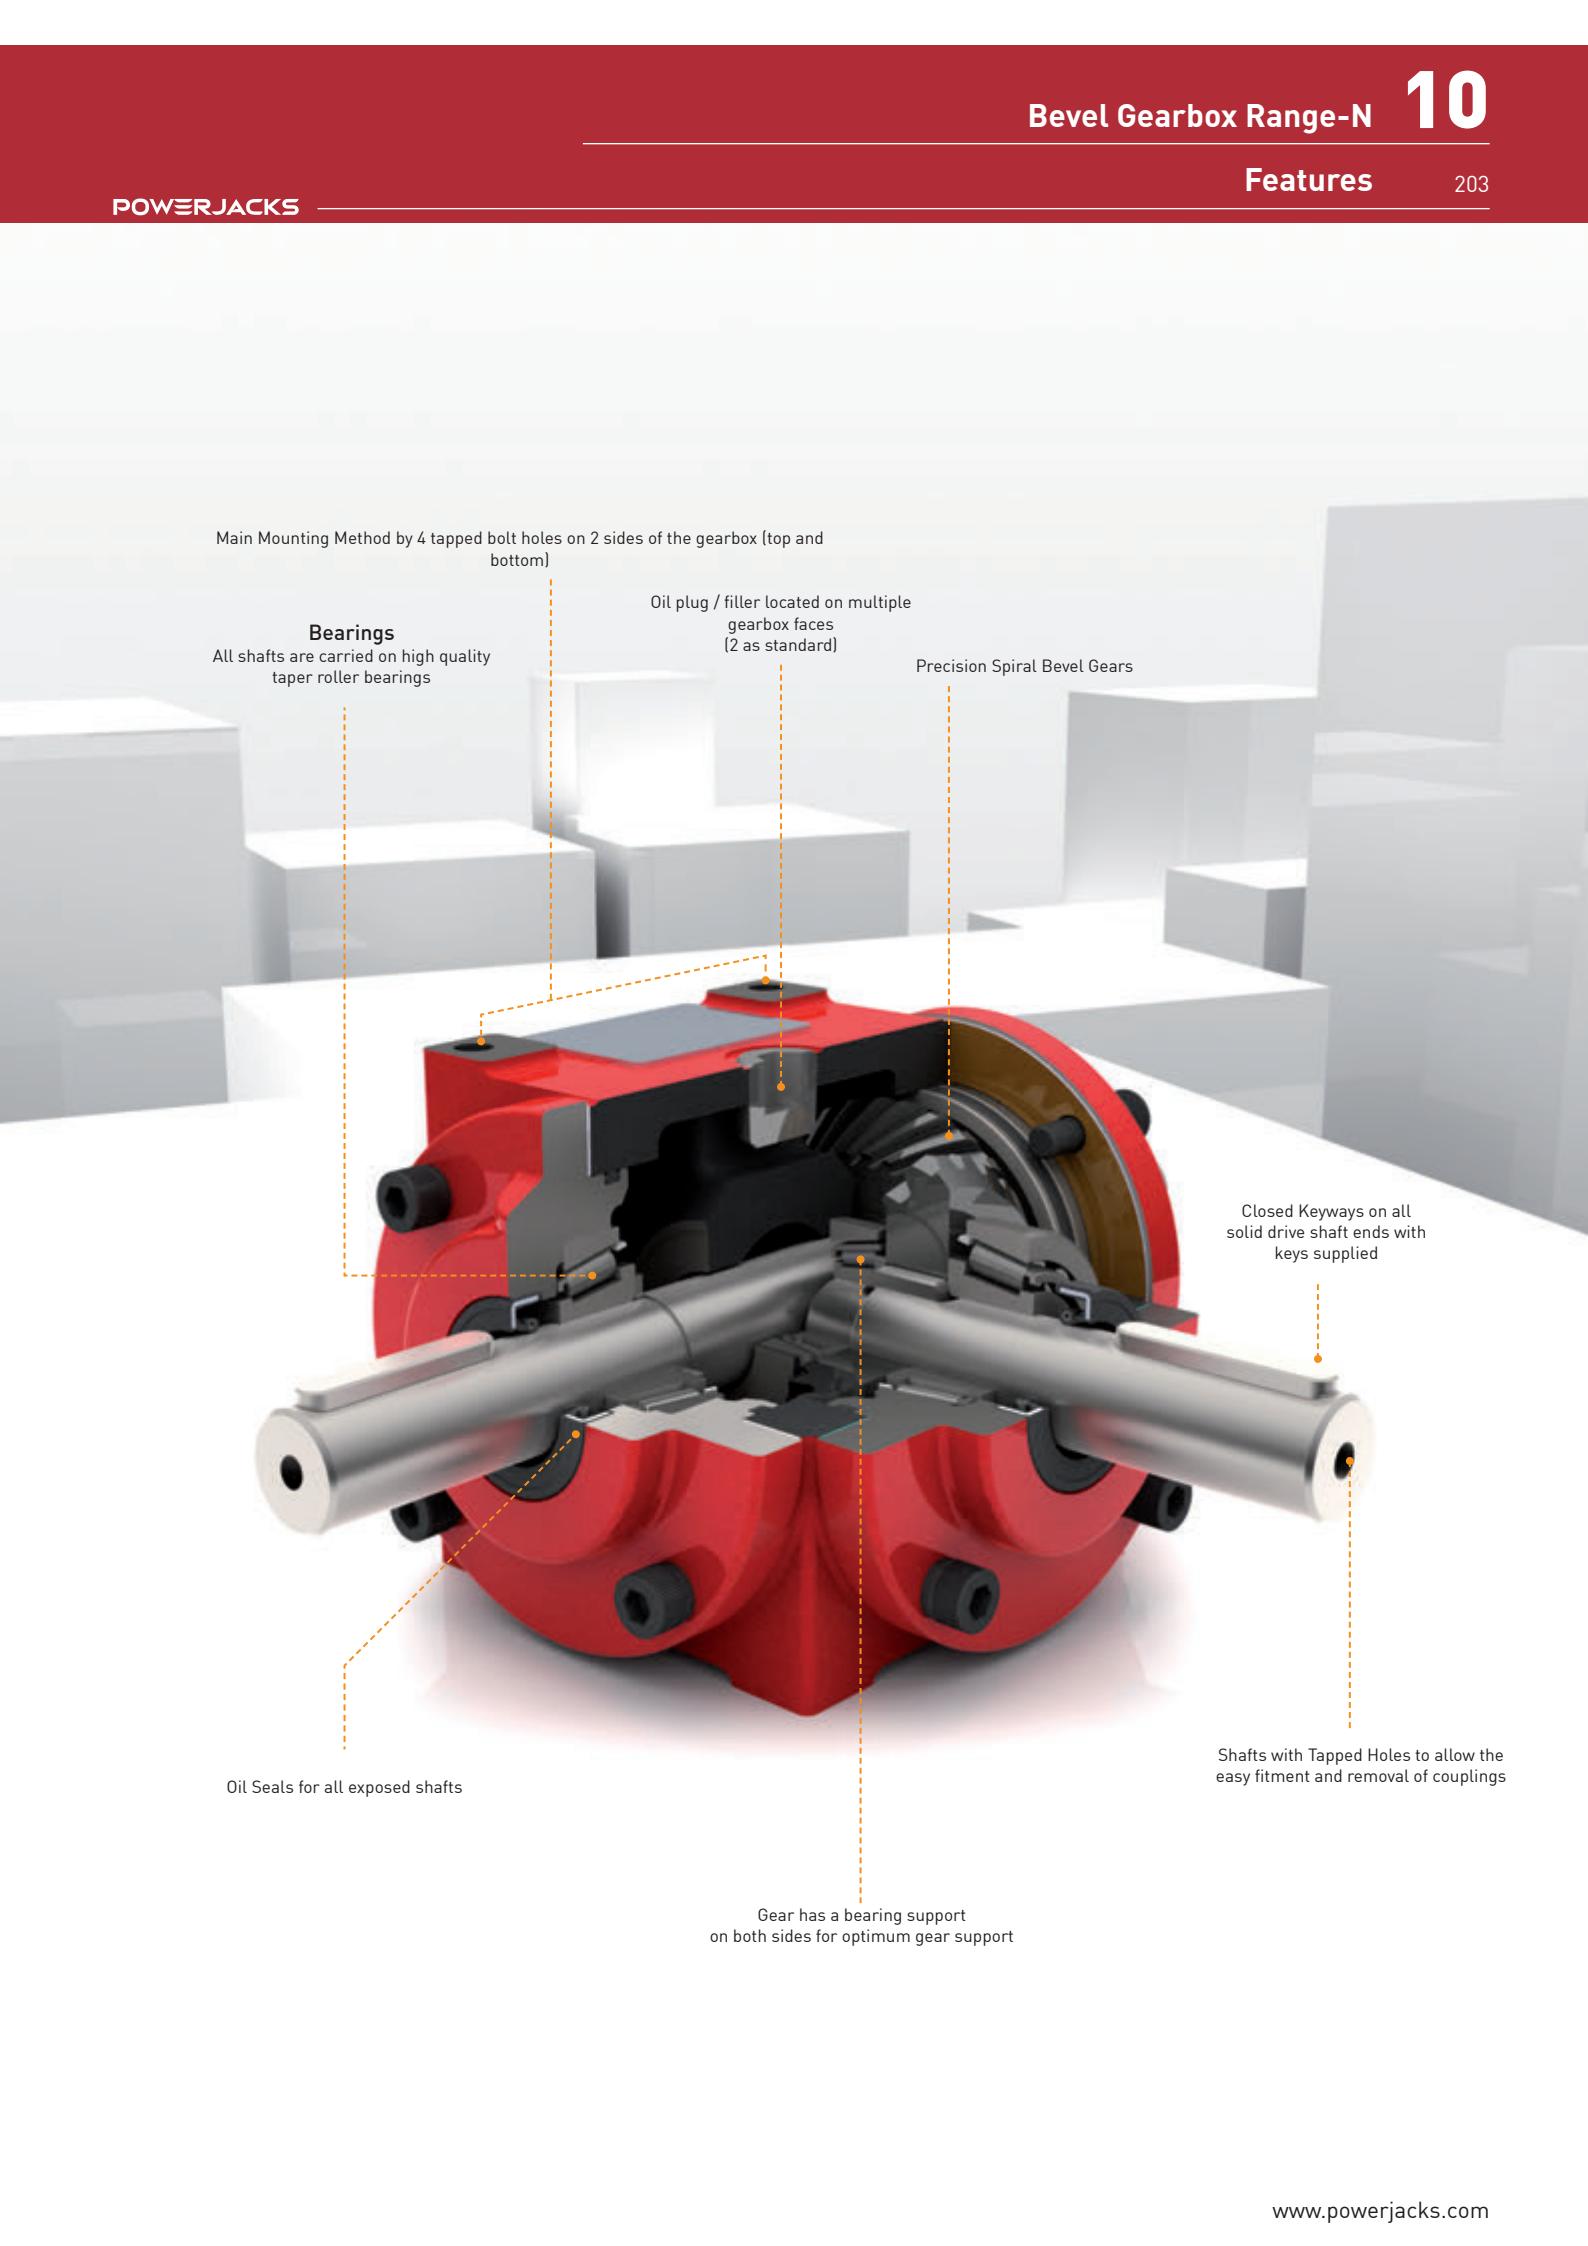

Superior Gear and Shaft Support

For gear ratios 1:1 and 1.5:1 where each gear has a bearing support on both sides. This gives optimum gear support and minimises bearing hub sizes for non-through shaft configurations.

Shaft Configurations

- 2, 3 or 4-way
- Solid or hollow shaft
- Special configurations available
- Motor Adapter to bolt an IEC motor directly to the gearbox input
- Service life of 10,000 hours for all gearbox sizes
- Input Speed up to 3000 rpm maximum
- Breather / vents available for high speed designs

Main Mounting Method by 4 tapped bolt holes on 2 sides of the gearbox (top and bottom)

Bearings

All shafts are carried on high quality taper roller bearings

Oil plug / filler located on multiple gearbox faces (2 as standard)

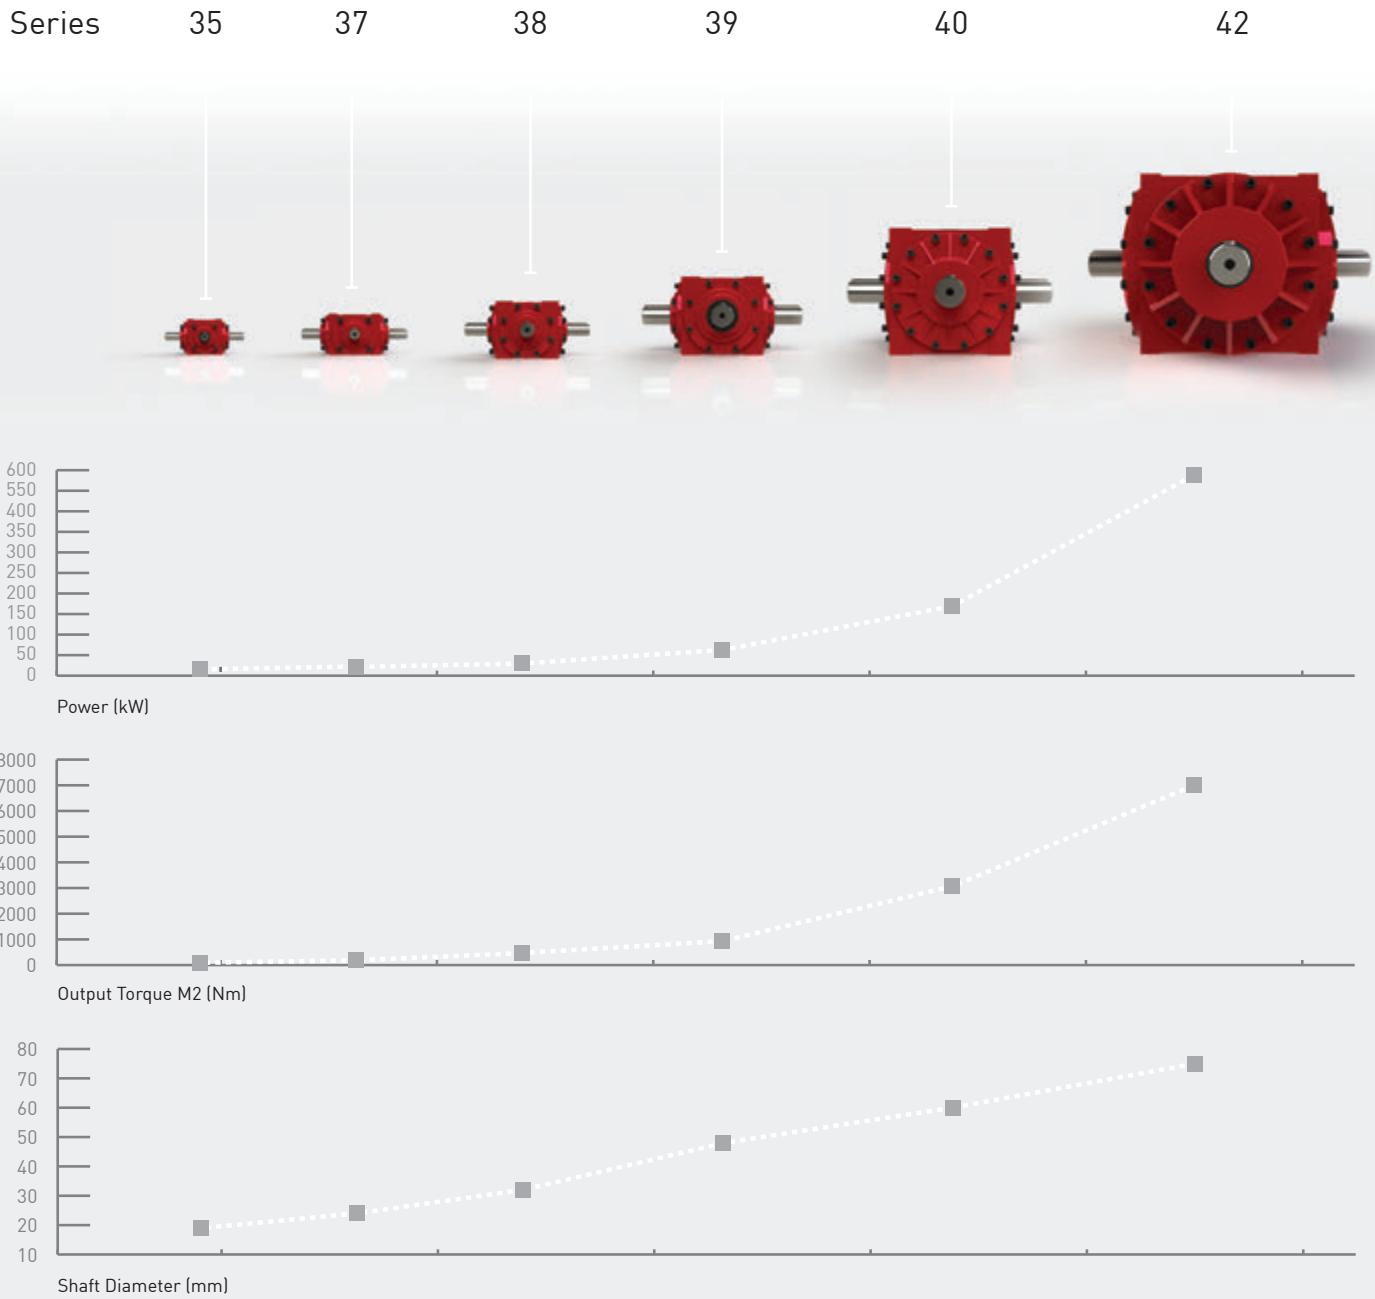

Precision Spiral Bevel Gears

Oil Seals for all exposed shafts

Closed Keyways on all solid drive shaft ends with keys supplied

Gear has a bearing support on both sides for optimum gear support

Shafts with Tapped Holes to allow the easy fitment and removal of couplings

Based on Ratio 1:1, 3way solid shaft, Gear Unit Size

Example

N380S30-10M06-0000-0000-000000 N-Range, 38 Series, Standard, Solid Shaft, 4-Way, Standard Gear Configuration, 1:1 Gear Ratio, Metric Shaft (mm) - Spiral Bevel, Standard Material Shafts lubrication and paint.

Notes:

- #1 Internal design revision number leave as XX and Power Jacks will update at time of order.
- #2 Not applicable to hollow shaft gearboxes.
- #3 Select if hollow shaft gearboxes with standard shaft designs on hollow shaft.
- #4 Keyless shaft design, typically for servo couplings.
- #5 Suitable for horizontal gearbox mounting, running within allowable speed limits for lubrication.
- #6 Common side for breather on horizontally mounted gearbox (on side 5) with oil lubrication
- #7 Common side for 90deg breather on 2-way or 3-way horizontally mounted gearbox (on side 5) with oil lubrication
- #8 The environment and temperature range specified here dictates the seal type and temperature rating of the gearbox, hence temperature rating / type of lubricant as well.
- #9 Type / Grade of lubricant defined by character 29 and 18

When selecting a gearbox, there are a number of factors which can influence the final size of unit selected. The information contained in the Selections gearbox characteristics and Technical data provide details of these factors for use in the selection process.

The following Selection Procedure provides a step-by-step guide to gearbox selection for those not fully familiar with the procedures. An example has been used in the selection procedure to assist in following through the procedure.

Specified information

Example Information

1. Gearbox Input Speed (rpm)	1000
2. Gearbox Output Speed (rpm)	500
3. Gearbox Configuration (page 213)	2 Way
4. Required Output Torque (Nm)	150
5. Operating Hours per Day (HRS)	10
6. Input Power Source (page 210)	Electric Motor
7. Gearbox Application (page 210)	Stacking Machine
8. Number of Starts per Hour (page 210)	8
9. Transmission Methods (page 210)	Clutch
10. Duty Cycle per Hour [% Running time]	45/60 = 75%
11. Operating Ambient Temperature °C (page 211)	20

Selection of Design Factors

Example Design Factors

Step 1 - Shock Load Factor (f_1) Using the Specified Information in Points 5, 6 and 7 above, select the Shock Load Factor from the Page 210.	1.25
Step 2 - Starting Frequency Factor (f_2) Using the Specified Information in Point 8 above, select the Starting Frequency Factor from the page 210.	1.00
Step 3 - Transmission Load Factor (f_3) Using the Specified Information in Point 9 above, select the Transmission Load Factor from the Page 210.	1.00
Step 4 - Thermal Limit - Duty Cycle - Factor (f_4) Using the Specified Information in Point 10 above, select the Thermal Limit - Duty Cycle - Factor from the Page 210.	1.25
Step 5 - Thermal Limit- Ambient Temperature - Factor (f_5) Using the Specified Information in Point 11 above, select the Thermal Limit - Ambient Temperature -Factor from the Page 211.	1.00

A gearbox is required for an Input Speed of 1000 rpm, an Output Speed of 500 rpm, an Output Torque of 150Nm and one Output Shaft. The Drive is by electric motor through a clutch mechanism and the gearbox is on the main drive of a heavy duty stacking machine. The machine operates for 10 hours per day, starts 8 times per hour and operates for 45 minutes in every hour, the other 15 minutes being taken up in loading the machine. The ambient temperature of the premises is 20°C.

Calculated data

Example Data

Step 6 - Calculate the Gear Ratio Input Speed ÷ Output Speed Note: If the gear ratio does not correspond to one of the STANDARD ratios contained in this technical manual, one of the speeds, normally the output speed, must be changed to bring the ratio to standard. Non-standard ratios can be supplied, if required, but such special selections must be referred to Power Jacks.	1000/500 = 2 Therefore 2:1 Reduction
Step 7 - Calculate the Corrected Output Torque Required Output Torque $\times f_1 \times f_2 \times f_3$ Note: Where there is more than one output shaft, the Required Output Torque for the gearbox is the summation of the individual Output Torques from the output shafts.	$150 \times 1.25 \times 1.00 \times 1.00 \times 1 = 187.5 \text{ Nm}$
Step 8 - Calculate the Corrected Output Power Required Output Torque \times Output Speed / 9550	$(187.5 \times 500) / 9550 = 9.82 \text{ kW}$
Step 9 - Calculate the Required Input Power = Output Power / Efficiency (Gearbox efficiency is between 95% and 98% after initial running in).	$9.82 / 0.98 = 10.02 \text{ kW}$

Gearbox Selection

Example Gearbox Selection

Step 10 - From the GEARBOX TORQUE x POWER RATING TABLE (page 209), select the gearbox with the closest adequate rated power.	From the Selection Table on page 209, for Input Power 10.02 kW, gear ratio 2:1 and Input Speed 1000 rpm, select Series 39.
Step 11 - When selecting a gearbox, the Thermal Capacity of the gearbox chosen must be considered. For the Limiting Thermal Capacity (page 211), expressed as a Power Rating. For the selected gearbox, calculate the Thermal Capacity = Limiting Thermal Capacity $\times f_4 \times f_5$. The Calculated Input Power must not exceed this Calculated Thermal Capacity. A larger gearbox must be selected if the Calculated Input Power is higher and a check run on the other parameters.	From the table in page 211, Limiting Thermal Capacity for Series 39 is 49kW. Calculate the gearbox, Thermal Capacity = $49 \times 1.25 \times 1.00 = 61.25 \text{ kW}$ The Input Power is within this limit. Selected gearbox is OK.
Step 12 - As a final check on the capacity of the chosen gearbox, the effect of the connected drive systems must be considered. The section headed Permissible Shaft Loading (page 212) describes the calculation to be undertaken where the transmission mechanism can give rise to radial and/or axial forces on the gear shafts. This occurs, particularly, where chain and belt drives are employed.	Power transmission is by clutch. From the Transmission Load Factor table (page 210 (f_j)), there are no additional loads to be considered and the selection of gearbox is acceptable.

Series		35	37	38	39	40	42
Torque (Nm)	Nominal ^{#1}	46	115	328	481	1353	6195
	Max Running ^{#2}	93	187	505	935	3088	7000
	Max Start-Up	140	281	758	1403	4632	10500
Input Speed	Max (rpm)	3000	3000	3000	3000	3000	3000
Thermal Limit	Power (kW)	3.3	9	20.5	49	90	190
Backlash	arcmin	9 to 16	9 to 16	9 to 16	7 to 10	7 to 10	7 to 10
Efficiency (%)		95% - 98%					
Service Life	(hours)	>10000	>10000	>10000	>10000	>10000	>10000
Housing Material		SG Iron	SG Iron	SG Iron	SG Iron	SG Iron	SG Iron
Oil Quantity	Litres	0.14	0.29	0.75	1.71	3.27	7
	Pints	0.24	0.5	1.32	3	5.75	12.3
Weight (kg)	2 Way - 1:1 & 1.5:1	4.5	10.5	20	38	112	190
	2 Way - 2:1 +	6.5	12	23	45	126.5	215
	3 Way - 1:1 & 1.5:1	4.75	11	20.5	46.5	116	197
	3 Way - 2:1 +	6.75	12.5	23.5	53	131	223
	4 Way - 1:1 & 1.5:1	5	11.5	21	55	120	204
	4 Way - 2:1 +	7	13	24	61	135.5	231

The above tables and other torque & power tables are on the basis of the following nominal values:

- 1 Shock-free operation
- 2 Operating time per day = 8 hours
- 3 Maximum 20 starts per hour (torque x 1.5 permissible)
- 4 Duty cycle 100%
- 5 When selecting gearboxes take the thermal capacity into consideration
- 6 Ambient temperature for operation -10° to +50°C permissible

Notes:

- #1 Nominal torque values at running speeds of 1500 rpm
- #2 Maximum running torque value at speed of 10 rpm

Lubrication

The oil levels stated in the table above assumes that the gearbox is positioned with all shafts in a horizontal plane. To get the correct lubrication recommendation please supply shaft orientation and operating speeds required as part of the application details provided to Power Jacks with an enquiry.

! All Neeter Drive Range-N gearboxes are shipped without lubrication, except for grease filled units.

Input Speeds: 250 rpm < n

For input speeds below 250 rpm then a grease filled gearbox is recommended.

Input Speeds: 250 rpm < n < 1500 rpm

Oil Specification

Ambient Temperature	Gear Oil
Below +5C	ISO 150
+5C to +40C	ISO 220
Above +40C	ISO 320

Input Speeds: n > 1500 rpm

For input speeds above 1500 rpm a change in oil level may be required in combination with a breather (vent). Consult Power Jacks for specific application advice.

Grease Specification

Use an EP1 rated grease.

■ Check Thermal Limit - Power

■ Check Thermal Limit - Torque

Power Ratings (kW) @ given INPUT speeds (rpm)

Output Torque M2 (Nm) @ given INPUT speeds (rpm)

Shock Load Factor (f_1)

Shock Load Category		
I	II	III
Conveyor Belts	Heavy Duty Lifts	Punching Machine
Generators	Hoists	Shears
Ventilators	Mixers	Forging Presses
Light Textile Machinery	Cranes	Vibrators
Rotating Machine Tools	Heavy Duty Textile Machinery	Rolling Mills
	Woodworking Machinery	Extremely Heavy Lifts
	Paper Machinery	Heavy Duty Roller Conveyors

Shock Load Category	Input Power Source								
	Electric Motor			Piston Machine Hydro Motor			Single Cylinder Piston Machine		
	Operating Time per Day (hrs)			Operating Time per Day (hrs)			Operating Time per Day (hrs)		
	≤2	10	>10	≤2	10	>10	≤2	10	>10
I	0.9	1	1.25	1	1.25	1.5	1.25	1.5	1.75
II	1	1.25	1.5	1.25	1.5	1.75	1.5	1.75	2
III	1.5	1.5	1.75	1.75	2	2.25	2	2.25	2.5

Starting Frequency Factor (f_2)up to 20 starts per hour $f_2 = 1.0$ up to 60 starts per hour $f_2 = 1.1$ up to 200 starts per hour $f_2 = 1.3$ up to 600 starts per hour $f_2 = 1.5$

more than 600 starts per hour (on request)

Transmission Load Factor (f_3)

The total load on the drive shafts and their bearing is the result of:

- a. The loads arising from the gear teeth
- b. The axial and radial loads arising from the transmission mechanisms attached to the drive shafts. It is this load which must be considered when selecting the gearbox and shaft sizes.

Depending upon the type of transmission mechanism used in connecting the gear shafts to the driving and driven loads, axial and / or radial loads can be applied to the gearbox shafts and their bearings.

These loads can arise from:

- either preload, due for example, to tension loading in belts
- or dynamic forces, due for example, to out-of-balance in the transmission element
- or shock load, due for example, to snatching in a chain drive.

The following table gives the factors which should be used to correct the Output Torque when sizing the gearbox.

Transmission Load Factor (f_3)		
Transmission Mechanism	Preload	Dynamic
Clutches	-	1
Gears of all Types	-	1.00 to 1.25
Chains	1.00 to 1.25	1.25 to 1.50
Flat Belts	2.00 to 2.50	1.00 to 1.25
V-Belts, Toothed Belts	1.50 to 2.00	1.00 to 1.25

Due to the compact design of this range of spiral bevel gear units the ratings are controlled by the thermal capacity at some speeds. A maximum case temperature of 80°C is specified and temperatures in excess of this figure normally indicate either incorrect oil levels or too much power being handled by the unit. If this temperature is exceeded Power Jacks should be consulted.

Thermal Limit - Duty Cycle - Factor (f_4)

Duty cycle per hour is the percentage of the time per hour during which the gearbox will be on-load.

Duty Cycle per Hour [%]	100	80	60	40	20
Thermal Limit Factor, f_4	1	1.25	1.5	1.75	2

Thermal Limit - Ambient Temperature - Factor (f_5)

Ambient Temperature °C	10	20	30	40	50
Thermal Limit Factor, f_5	1.2	1	0.87	0.75	0.62

Limiting Thermal Capacity

The capacity of some gears is limited by the maximum permissible temperature of the oil bath. The charts below show the limiting thermal capacities, which can be transferred without cooling at an ambient temperature of 20°C and duty cycle of 100% per hour.

Series	35	37	38	39	40	42
Power [kW]	3.3	9	20.5	49	90	190

WARNING: The case temperature must not exceed 80°C, (see thermal limits).

Power Jacks should be consulted if a gear unit is to be installed with a shaft positioned vertically.

After selecting the gearbox for the required duty it is necessary to check that the axial and radial loading arising from the transmission mechanism is acceptable for the gear shaft diameters on the selected gearbox (gear shaft diameters are given on the Dimensions page for the chosen design).

The bearing configuration on the shafting, the shaft diameter and the shaft speed determine the permissible external loading which can be carried by the shaft without bearing or shaft failure. The graph showing permissible radial forces on shafts has been drawn for a typical Output Shaft. In this arrangement the bearing centres are mounted at either end of the through shaft and there is a significant span which allows higher radial loads to be accepted, see sketch below. For typical Input Shafts and Output Shafts, which are overhung from the gearbox face, the bearing centres are closer together and the radial load carrying capacity is reduced, see sketch below.

To calculate the Permissible Loading on the gearbox shafts, use the gearbox output and input speeds and diameters respectively.

1. Read off the Permissible radial Force for the nearest diameter shafts from the graph below.

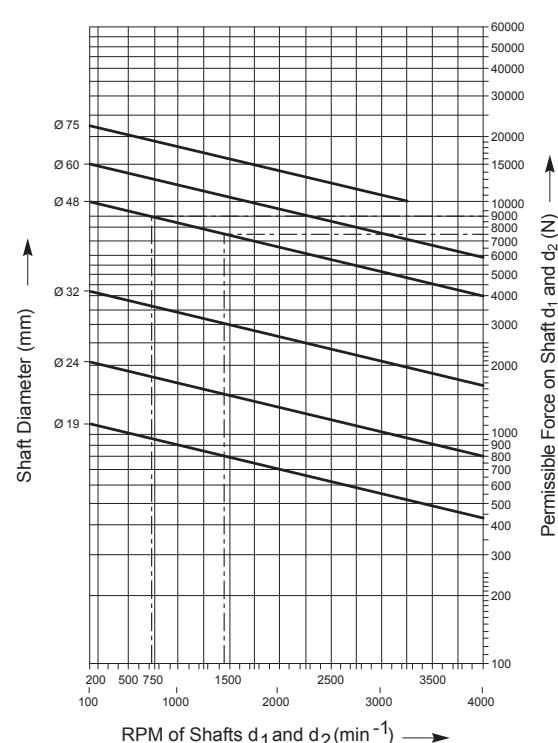

2. Use the Correction Factors, below, to calculate the Permissible Radial and Axial Loads for each of the gearbox shafts.

Correction Factors

	Output Shaft (Bearings on through shaft)	Input Shaft (Bearings on overhung shaft)	Output Shaft (Bearings on overhung shaft)	Gearboxes with Centre bearing
Permissible Radial Forces	1.00	0.66	0.66	0.40
Permissible Axial Forces	0.50	0.50	0.50	0.50

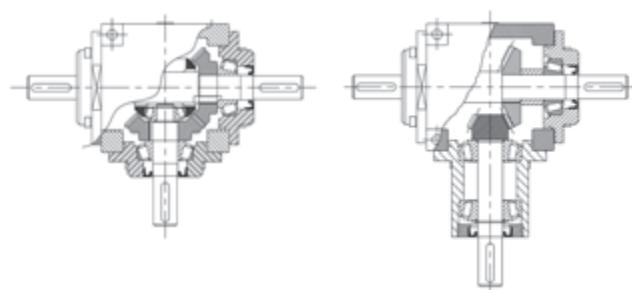

The calculated loads should be checked against the radial and axial loads provided by the manufacturer of the transmission mechanism. If the loading created by the transmission mechanism exceeds the permissible level, a gearbox with a larger diameter shaft is required. At this point Power Jacks should be consulted as it is often possible to fit a special shaft arrangement into a standard gearbox.

Permissible Shaft Loading Curves

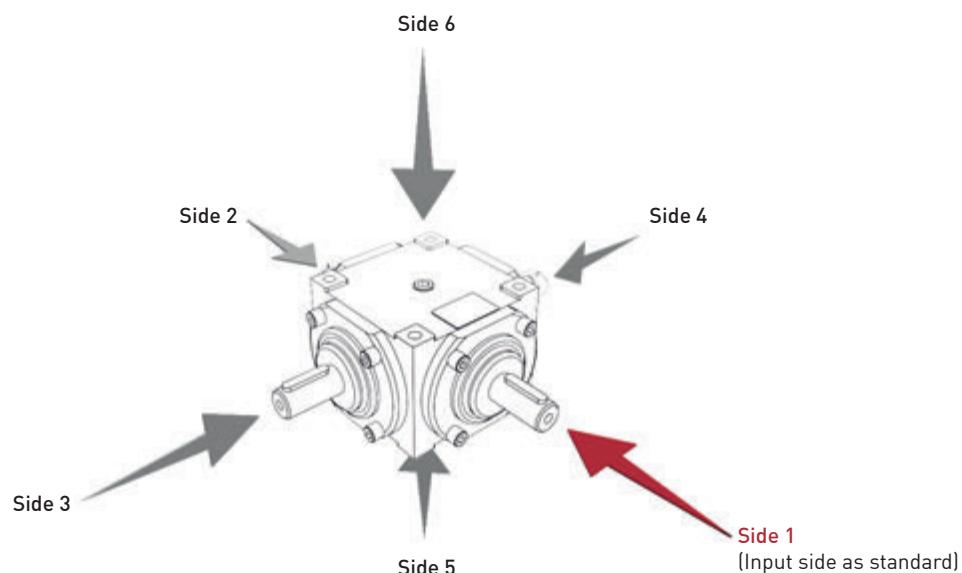

Example: Series 39, Ratio 2:1, 1440 rpm Input

Ød1	=	48	permissible radial force 7500 N x 0.66 = 4950 N permissible axial force 4950 N x 0.50 = 2475 N
Ød2	=	48	permissible radial force 9000 N x 1.00 = 9000 N permissible axial force 9000 N x 0.50 = 4500 N

Torque (Nm)	Nominal#1	328
	Max Running#2	505
	Max Start-Up	758
Input Speed	Max (rpm)	3000
Thermal Limit	Power (kW)	20.5
Backlash	arcmin	9 to 16
Efficiency	(%)	95% - 98%
Service Life	(hours)	>10000
Housing Material		SG Iron
Oil Quantity	Litres	0.75
	Pints	1.32
Weight (kg)	2 Way - 1:1 & 1.5:1	20
	3 Way - 1:1 & 1.5:1	20.5
	4 Way - 1:1 & 1.5:1	21

Notes:

#1 Nominal torque values at running speeds of 1500 rpm

#2 Maximum running torque value at speed of 10 rpm

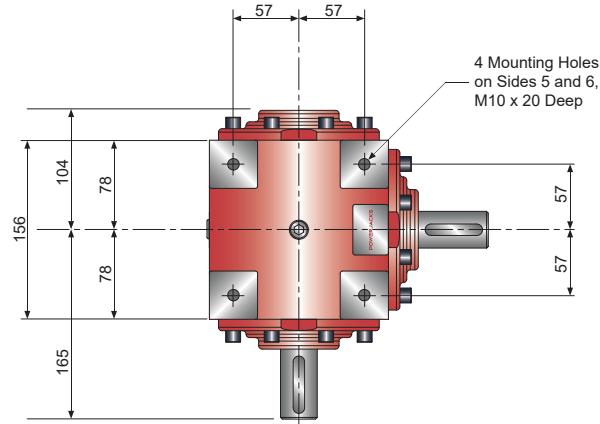

Full detailed performance for each unit refer to page 208 & 209

Accessories & Options

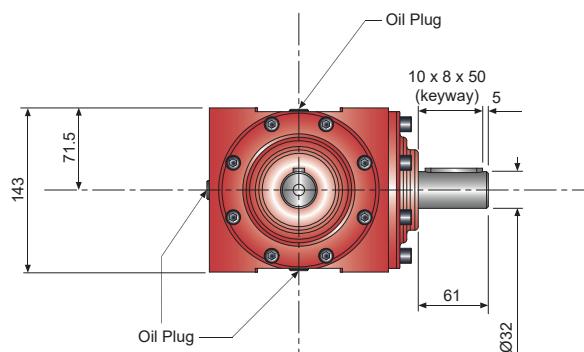

2 Way Solid Shaft

N380S20-10

Tapped hole in end of each solid drive shaft - M10 x 25mm Deep

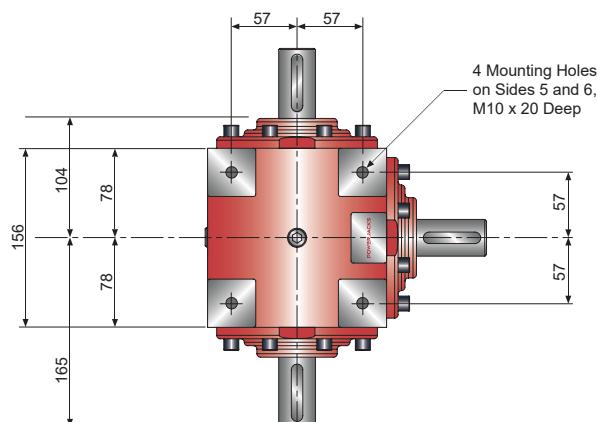

Notes:

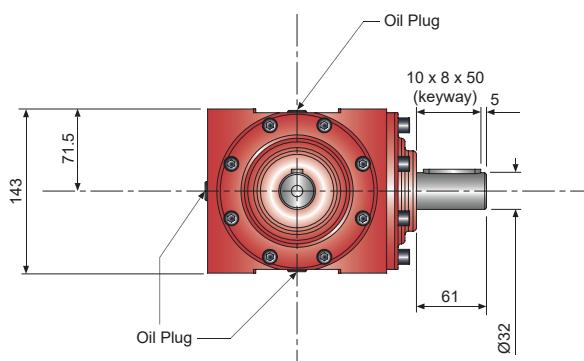

1. All dimensions in mm unless otherwise stated
2. Dimensions subject to change without notice

3 Way Solid Shaft

N380S30-10

Tapped hole in end of each solid drive shaft - M10 x 25mm Deep

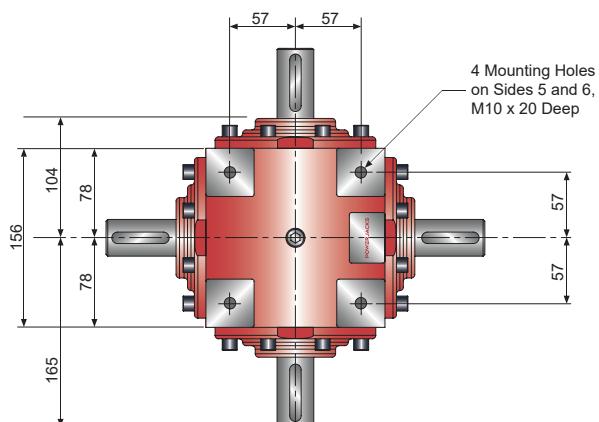

Notes:

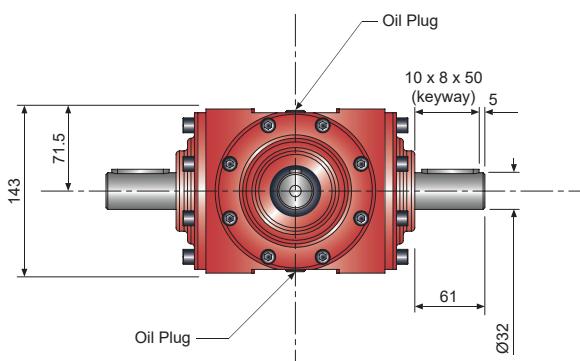

1. All dimensions in mm unless otherwise stated
2. Dimensions subject to change without notice

4 Way Solid Shaft

N380S40-10

Tapped hole in end of each solid drive shaft - M10 x 25mm Deep

Notes:

1. All dimensions in mm unless otherwise stated
2. Dimensions subject to change without notice

250 : 2 Pole	40	All	310	L

- Notes:
1. All standard motor adapters use a B5 IEC flange.
 2. All Flange dimensions conform to standard IEC electric motor details.
 3. NEMA flanges available on request.

Extended Drive Shafts

For each gearbox size the drive shafts (input or output) can be extended in length for solid shaft or hollow shaft designs.

For an application these designs can:

- Eliminate the need for extra drives shafts.
- Reduce the number of couplings.
- Reduce the overall installation cost.
- Reduce the associated maintenance and spare parts inventory and cost.
- Allow the machine design to be fully optimised.

Stainless Steel Bevel Gearboxes

Stainless steel gearboxes are recommended for use in applications which require one or more of the following properties:

- High corrosion resistance.
- Hygienic for food processing.
- Good chemical resistance.
- Resistance to fire & high temperatures.
- Strength at low temperatures.
- Stainless steel has good recycling options.
- Easy to clean surfaces.
- Non-magnetic options available.

All of which makes stainless steel gearboxes ideally suitable for industries such as marine, paper, chemical, food, beverage, nuclear, oil and gas.

U-Series Underwater / Subsea Gearbox

The U-Series subsea bevel gearboxes are a proven and reliable technology for subsea drive solutions down to a depth of 3000m. They are used in a wide variety of underwater applications in the oil & gas and even the nuclear sector. Each submersible variant is tailored exactly to the customer application.

Subsea Design Features

- Proven depth ratings up to 3000m subsea (deeper on request)
- Pressure compensated or flooded designs available
- Full stainless steel designs available
- Reinforced sealing
- Full range of anti-corrosion options
- ROV drive interfaces
- Low (-65°C) to High (+250°C) temperature solutions available
- Vibration and shock load resistant designs
- Full range of feedback devices for speed, position and rotation
- Special custom designs available to meet your exact requirements

Standard Gearbox

- Six gearbox sizes
- 35, 37, 38, 39, 40, 42 Series
- Nine gearbox configurations
- Gear ratios: 1:1, 1.5:1, 2:1, 3:1, 4:1 as standard
- Special gear ratios available on request, e.g. 1.25:1
- Torque ratings up to 20000 Nm
- Option for reinforced shaft design for up to 300% higher torque transmission

Reliable Spiral Bevel Gear

With a proven design already used in millions of gearboxes, the Precision Spiral Bevel Gears, with accurate gear mesh, deliver high torque with smooth and quiet transmission.

Shaft Configurations

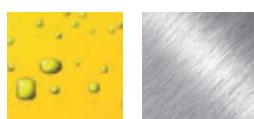

- 2, 3 or 4-way
- Solid or hollow shaft
- Special configurations available
- ROV torque receptacle integrated to gearbox drive
- ROV paddle adapter fitted to input drive shaft
- Motor adapter for direct connection of subsea motor to gearbox input
- Service life of 10,000 hours for all gearbox sizes
- Input speed up to 3,000 rpm maximum

Gearbox Housing

A rugged compact design made from a highly durable SG iron as standard or stainless steel on request.

It provides a strong housing that firmly and accurately holds the gear set in a reservoir of quality lubricant suited to the demands of subsea work.

Corrosion Protection

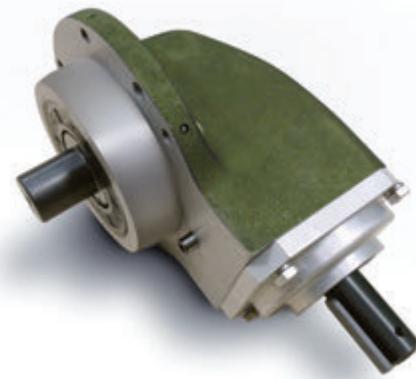

- To suit all economic needs
- Standard subsea paint finish
- Customer specified paint
- Plated finish
- Stainless steel

Design Possibilities / Designed For You

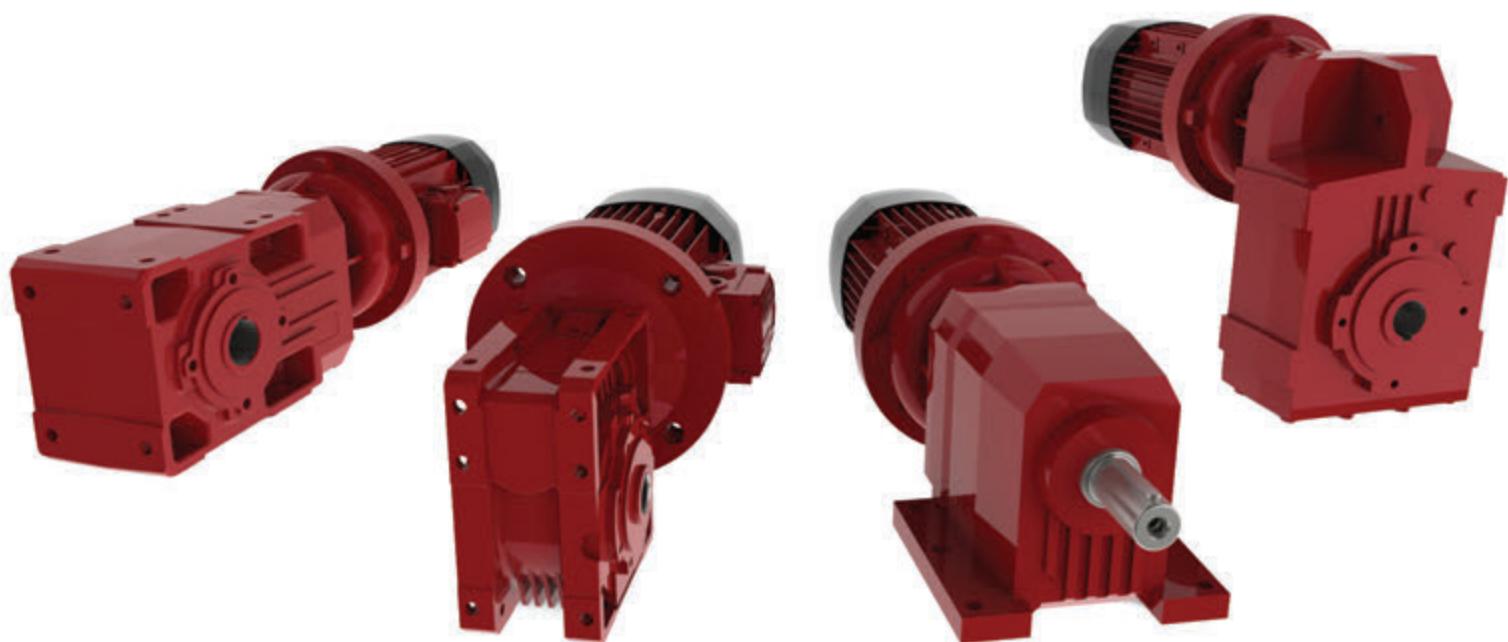

The Range-N bevel gearboxes are provided as a range of standard bevel gearboxes and as a range of engineered gearboxes. Each gearbox design can be altered to suit exact application requirements such as:

- Low weight designs.
- Long or short drive shafts.
- Keyless shafts.
- Shafts with threaded sections.
- Alternative shaft profiles e.g. hexagonal.
- Nuclear rated gearboxes.
- Food & beverage processing grade gearboxes.
- Special shaft sealing.
- Integrated or bolt on base flange.
- Extra mounting holes.
- Motor adapters for servo, hydraulic or air motors.
- Integrated limit switches.
- Protective shaft covers.
- High & low temperature rated designs.
- Alternative housing designs e.g. curved.
- High corrosion & chemical resistant designs.

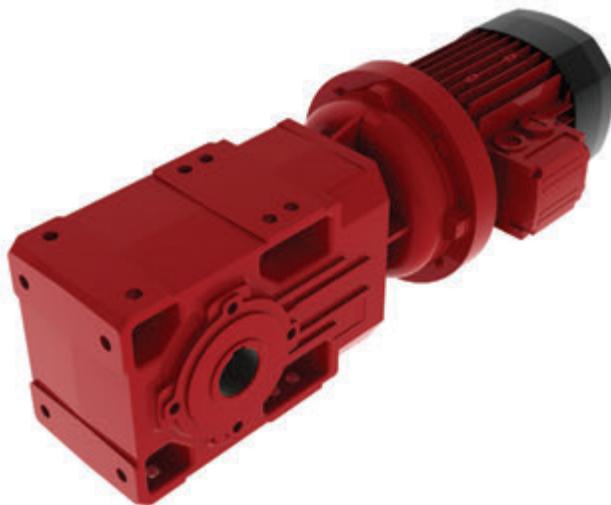

Use Power Jacks engineering technology to bring your concept to reality.

A 55	2000
A 60	2800
A 70	5000
A 80	8000
A 90	14000

Torque Range

100 Nm to 14000 Nm

Power Rating

0.22 kW to 150 kW (at 1400 rpm input)

Gear Ratios

5.4:1 to 1715:1

Output

Foot and shaft mount - two bore options size
Keyless shrink disc fitting
Metric or Inch series solid output shaft
Taper bushing
Splined Hollow shaft to DIN 5480

Input

IEC and NEMA motor adaptors
Servo motor adapters
Metric or inch series solid input shaft

Main gear options

Backstop
Reinforced bearings for higher overhung load capacity
Reduced backlash
Taconite seals

AC Motors

Integral motors and brake motors
IEC motors and brake motors
Single and dual speed motors

Main brake features

DC and AC supply
Fast brake engage/disengage through
electronically controlled AC/DC rectifiers.

Main motor options

Thermistors and thermostat sensors
Separate supply forced ventilation
Line driver and push-pull incremental encoder

C 100	12000

Torque Range

45 Nm to 12000 Nm

Power Rating

0.08 kW to 213 kW (at 1400 rpm input)

Gear Ratios

2.6:1 to 1481:1

Output

Foot and Flange mount

Metric or inch series solid output shaft

Input

IEC and NEMA motor adaptors

Servo motor adapters

Metric or inch series solid input shaft

AC Motors

Integral motors and brake motors

IEC motors and brake motors

Single and dual speed motors

Main brake features

DC and AC supply

Fast brake engage/disengage through electronically controlled AC/DC rectifiers.

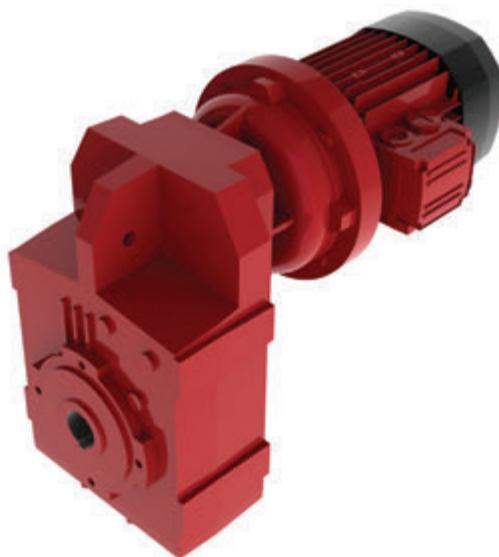

Main motor options

Thermistors and thermostat sensors

Separate supply forced ventilation

Line driver and push-pull incremental encoder

F-series - Parallel Shaft Helical Gearbox

Size	Torque [Nm]
F 10	140
F 20	250
F 25	400
F 31	600
F 41	1100
F 51	1800
F 60	2900
F 70	5000
F 80	8000
F 90	14000

Torque Range

140 Nm to 14000 Nm

Power Rating

0.17 kW to 125 kW (at 1400 rpm input)

Gear Ratios

6.4:1 to 2099:1

Output

Keyed hollow shaft - two bore options per size

Keyless shrink disc fitting

Plug-in solid output shaft as an option

Input

IEC and NEMA motor adaptors

Servo motor adapters

Metric or inch series solid input shaft

AC Motors

Integral motors and brake motors

IEC motors and brake motors

Single and dual speed motors

Main brake features

DC and AC supply

Fast brake engage/disengage through electronically controlled AC/DC rectifiers.

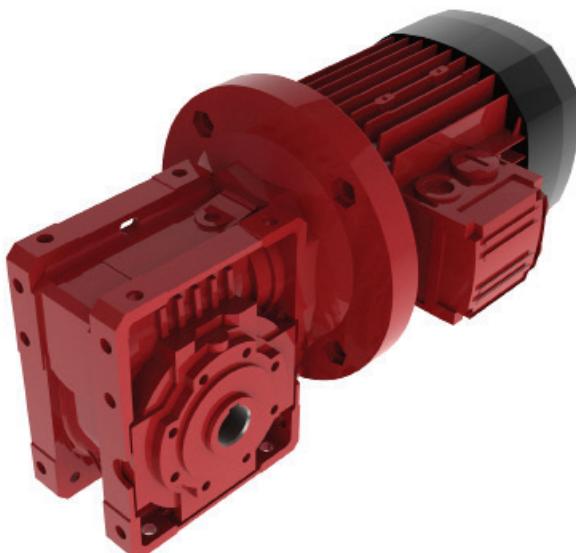

Main motor options

Thermistors and thermostat sensors

Separate supply forced ventilation

Line driver and push-pull incremental encoder

VF & W - Series - Worm Gearbox

Size Torque [Nm]

VF 27	13
VF 30	24
VF 44	55
VF 49	88
VF 63	190
VF 75	320
VF 86	440
VF 110	830
VF 130	1500
VF 150	2000
VF 185	3600
VF 210	5000
VF 250	7100

Torque Range

13 Nm to 71000 Nm

Power Rating

0.04 kW to 75 kW (at 1400 rpm input)

Gear Ratios

7:1 to 10000:1

Output

Keyed hollow shaft

Plug-in solid output shaft

Torque limiter as an option

Input

IEC motor adaptors

Solid input shaft

AC Motors

Integral motors and brake motors

IEC motors and brake motors

Single and dual speed motors

Main brake features

DC and AC supply

Fast brake engage/disengage through electronically controlled AC/DC rectifiers.

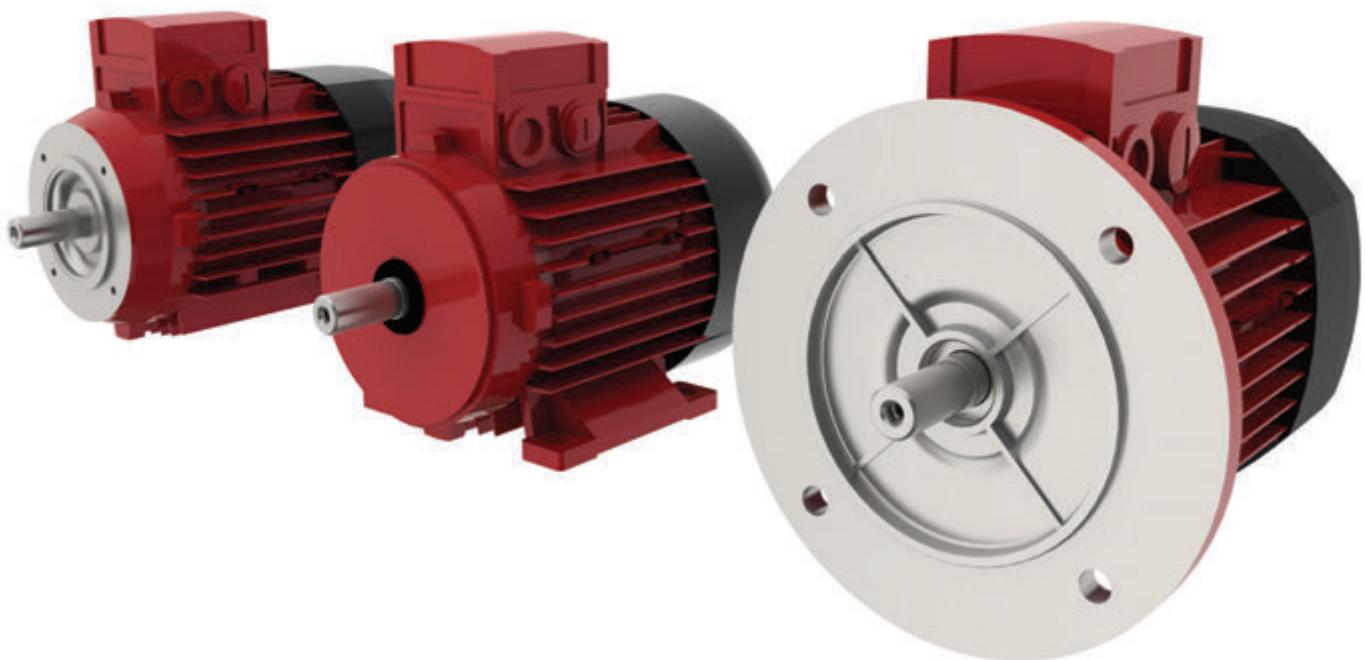

Main motor options

Thermistors and thermostat sensors

Separate supply forced ventilation

Line driver and push-pull incremental encoder

POWER JACKS CAN SUPPLY ELECTRIC MOTORS FOR ALL APPLICATIONS WHETHER AC OR DC MOTORS ARE REQUIRED.

Power Jacks can supply electric motors for all applications whether AC or DC motors are required. Detailed in this section of the Design Guide are some of the most popular motors used in industrial applications.

Ac Induction Motors

Standard Specification

- 3 Phase, 50 Hz / 60Hz.
- Voltages:
 - IEC Frame 56 - 132
 - 230 / 400 V - Δ / Y - 50 Hz (standard)
 - 400 / 690 V - Δ / Y - 50 Hz (on request)
 - 460 V - Y - 60 Hz (standard)
 - IEC Frame 160 - 200
 - 400 / 690 V - Δ / Y - 50 Hz (standard)
 - 460 V - Δ - 60 Hz (standard)
- B3 Foot, B5 Flange and B14 Face Mounting.
(or a combination).
- 2 Pole (3000 rpm)
- 4 Pole (1500 rpm)
- 6 Pole (1000 rpm)
- 8 Pole (750 rpm)
- IEC Frame Sizes 63 to 200.
- Enclosure IP55, TEFV.
- S1 Continuous rating.

Optional

- Brake motors - AC or DC units.
- 2 and 8 Pole 3 phase AC motors.
- Single phase AC motors.
- DC motors - permanent magnet or servo.
- Cast Iron or Steel construction motors.
- High altitude and high temperature options.
- Integral AC inverter.
- Integral Incremental or Absolute encoder.
- Forced ventilation.
- Enclosures IP56 to IP68.
- Tropicalised motors.
- NEMA and Japanese standard units.
- Marine motors.
- Explosion proof motors, including ATEX motors.
- Anti-Condensation Heaters
- Thermistors
- H-Class Insulation
- Brake hand release
- Plug-in connectors
- Second output shaft.

Features

- Standard Efficiency of IE1. Other efficiency ratings of IE2, IE3 and IE4 are available on request.
- Low noise levels.
- High power factors.
- High torque with smooth acceleration and low current.
- Aluminium construction for light weight and corrosion resistance.

Brake Motor

The brake units are a single disc type mounted on the non-drive end-shield of the motor and can be either DC or AC types. They are spring applied electrically released units, which provide fail to safe operating characteristics such that on interruption, or failure of power supply, the brake will engage and arrest the load.

With DC brakes, the brake coil is fed via a rectifier in the motor terminal box and is automatically switched with the AC motor supply. AC brakes are connected directly to the motor terminals. They can however be separately energised from their own AC supply, in the case of inverter drives and/or where very fast brake operation is required.

The enclosure ratings for brake motors are IP54 as standard and IP55 on request. More enclosure ratings are available on request e.g. IP56.

Symbols	Units of Measure	Description
$\cos\phi$	-	Power Factor
η	-	Efficiency
f_m	-	Power adjusting factor
I	-	Cyclic duration factor
I_N	(A)	Rated current
I_s	(A)	Locked rotor current
J_c	(Kgm ²)	Load moment of inertia
J_M	(Kgm ²)	Moment of inertia
K_c	-	Torque factor
K_d	-	Load factor
K_j	-	Inertia factor
M_A	(Nm)	Mean breakaway torque
M_B	(Nm)	Brake torque
M_N	(Nm)	Rated torque
M_L	(Nm)	Counter-torque during acceleration
M_s	(Nm)	Starting torque

Symbols	Units of Measure	Description
n	(min ⁻¹)	Rated Speed
P_B	(W)	Power drawn by the brake at 20°C
P_N	(kW)	Motor rated power
P_r	(kW)	Required power
t_1	(ms)	Brake response time with one-way rectifier
t_{1S}	(ms)	Brake response time with electronic-controlled rectifier
t_2	(ms)	Brake reaction time with a.c. disconnect
t_{2C}	(ms)	Brake reaction time with a.c. disconnect
t_a	°C	Ambient temperature
t_f	(min)	Work time constant load
t_r	(min)	Rest Time
W	(J)	Braking work between service interval
W_{MAX}	(J)	Maximum brake work for each braking
Z	(1/h)	Permissible starting frequency, loaded
Z_0	(1/h)	Max. permissible unloaded starting frequency (I=50%)

Note

- For FD07 high torque brake value R=226 (consult Power Jacks for more details).

FULL RANGE OF COUPLINGS
AND DRIVE SHAFTS SO YOU
CAN BUILD COMPLETE
JACKING SYSTEMS.

Flexible Couplings

Selection of Coupling Type

The selection of coupling type depends on the installation and the type of misalignment. The three main types of misalignment encountered are:-

1. Angular Misalignment is usually present to some extent on all applications, typical values 1° - 2°. Sometimes higher values are necessary.
2. Parallel (Radial) Misalignment is also nearly always present. A well aligned installation might have values below 0.25 mm.
3. Axial Misalignment (End Float) sometimes caused by thermal expansion or as a result of machine design.

Other considerations include:

- Backlash Free Couplings are either one part couplings or have bolted joints. These are effective for precise positioning and to avoid wear on reversing drives.
- Torsional rigidity of couplings depends on the joining method. Types with rubber or plastic elements can be considered as torsionally soft and will have an amount of twist at rated torque.

Procedure:

1. Decide if the coupling should be torsionally soft or rigid.
2. Consider whether a small amount of backlash is acceptable.
3. Calculate the required coupling torque.
4. Make a provisional selection.
5. Check that the coupling's maximum speed is sufficient.
6. Check that the coupling's dimensions are acceptable.
7. Contact Power Jacks with your order or technical enquiry

Selection of Coupling Size:

$$\text{Coupling Torque, } T(\text{Nm}) = \frac{9550 * \text{Power Transmitted (kW)} * S}{\text{RPM}}$$

where S = Service Factor - dependant on drive conditions (refer to each coupling) Select the coupling which is rated above the calculated torque. If a brake is present in the system the coupling should be based on either the brake torque or the transmitted torque whichever is greater.

Note

1. Maximum misalignment values are extremes and should not be combined. As operating misalignment approaches the maximum, torque and power ratings should be reduced to maintain life.
2. Gear couplings accommodate parallel misalignment by converting it to angular misalignment at the gear meshes in the flexible halves of the coupling.
3. The maximum axial misalignment values apply when the coupling is aligned. If axial misalignment greater than the listed maximum is required, consult Power Jacks.
4. The inertia values includes shafts through the bores.
5. When ordering please quote the coupling size and type, specify the bore and keyway sizes, and advise if puller holes or set-screws are required.
6. For maximum performance, the actuators, shafts, Gearboxes and motor should be carefully aligned.
7. Imperial couplings on request.

Keyways	Metric	Imperial
Standard Bores	B.S. 4500 1969 H7	B.S. 1916 Part 1 1953 K7
Standard Keyways	B.S. 4235 Part 1 1967 P9	B.S. 46 Part 1 1958

Jaw Type Flexible Coupling

- Curved jaw design.
- No need for lubrication.
- Quick and simple to install.
- Reliable, rugged and compact.
- Smooth, silent action.
- High power transmission density.
- 4 Standard spider types available.
- Elastomeric element resistant to heat (-40°C to +90°C), grease, oil and chemical agents.
- Hubs in aluminium and sintered iron.

Note All couplings use 92 Shore elastomeric element (white) as standard. 80, 98 and 95 available on request.

Maximum torque must not be exceeded during start-up operation.

More accurate alignment will increase coupling life and reduce vibration. Dimensions "E" and "L" must be observed.

P = Consult Power Jacks for more details.

Couplings & Drive Shafts

POWERJACKS

Flexible Spacer Couplings (Self-Supporting Drive Shafts)

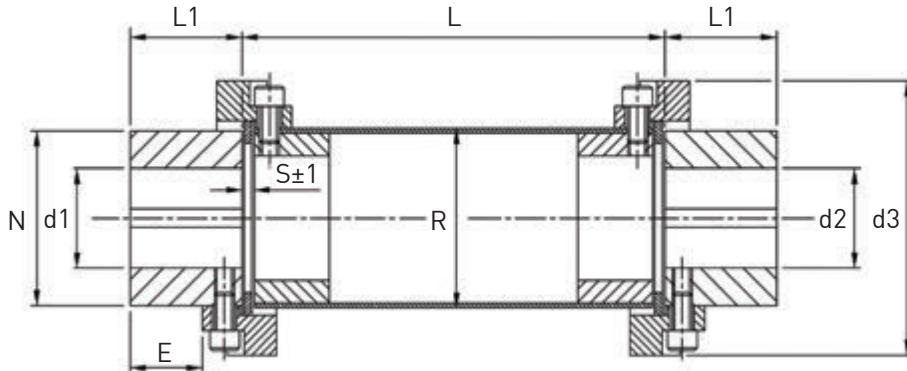

- Compact, light, robust, safe in operation, long service life.
- Two identical hubs and one flexible element.
- Hubs of high tensile steel.
- Large permissible bores, various hub lengths.
- Driving dogs have smooth surface, high durability.
- Generously proportioned compression-stressed flexible inserts.
- Damps vibrations and shocks, compensates for axial, radial and angular misalignment.

Elastomeric Element features:

- Inserts made of "90 Shore A" Polyurethane (G) as standard or tough "55 Shore D" Hytrel (H).
- Operating temperature range: -40°C to +80°C as standard
- Elastomeric element is resistant to oil and grease.

* Insert length, L here in millimetres.

Misalignment

Element Type	Radial (mm)	Axial (mm)	Angular (deg)
B-Standard	0.5	+/- 1	1
H-Hytrel	0.25	+/- 1	0.5

Note

The best possible alignment will result in the best coupling performance.

Service Factor

The service factor must be chosen according to working conditions between 1 (light duty) and 3 (arduous duty).

Critical Speed & Spacer length

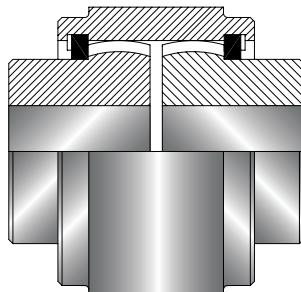

Spacer coupling lengths can be provided up to a maximum of 6m depending on rotational speed.

For advice on the critical speed of a given coupling consult Power Jacks.

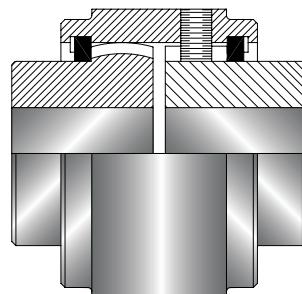

Steel Gear Couplings

Continuous Sleeve Steel Gear Coupling

- Vari-crown tooth form for improved torque transmission and longer life.
- Strong compact design.
- High transmittable torque ratings.

- Low inertia and high maximum speeds.
- Steel reinforced high misalignment seals.
- Spacer couplings available on request.

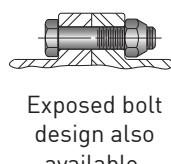

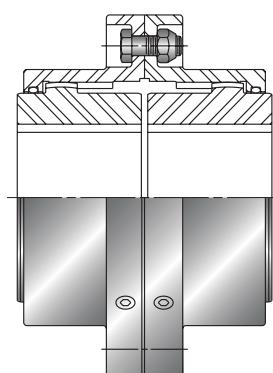

Full-Flex Gear Coupling

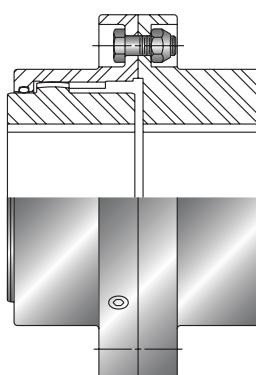

Two flexible hubs and sleeve assembly. Accommodates angular, parallel and axial misalignments.

Flanged Sleeve Steel Gear Coupling

- High transmittable torque ratings and high maximum speeds.
- Accommodates angular, parallel and axial misalignment.
- Strong forged steel hubs and sleeves

- Vari-crown tooth from improved torque transmission and longer life.
- Several mounting options available by reversing th hubs.
- Spacer gear couplings available. Consult Power Jacks

Flex-Rigid Gear Coupling

Flexible and rigid hub assembly. The flexible hub is standard and the rigid hub is splined into the sleeve. Accommodates angular and axial misalignment only.

Service Factors for Gear Couplings

Nature of Load on Unit	Uniform	Light Shock	Medium Shock	Heavy Shock
Service Factor, S	1.0	1.25	1.5	2.0

Note

1. All dimensions in millimetres.
2. These couplings are designed for grease lubrication. A list of suggested lubricants and quantities is detailed in the installation manual supplied with each full coupling.
3. Where a coupling is exposed to sustained temperatures above 100°C (212°F) a coupling with high temperature seals must be used, consult Power Jacks Ltd.

Couplings & Drive Shafts

POWERJACKS

Solid Drive Shafts

There are three standard drive shaft sizes offered by Power Jacks with ends machined to suit screw jack system couplings however drive shafts can be supplied to customer sizes with specific end designs

Standard Drive Shafts	Rated Torque (Nm)	Rated Angle of Twist per Metre (Degrees)
20mm Diameter	85	4
30mm Diameter	285	2.6
40mm Diameter	675	2

Note

1. For other drive shaft types and sizes consult Power Jacks Ltd.
2. For detailed analysis consult Power Jacks Ltd.
3. Dimensions subject to change without notice.

Select Drive Shaft Diameter

Select a standard drive shaft from the drive shaft table and check its torque rating and angle of twist rating against the application requirements.

If Transmitted Torque (Nm) < Maximum Drive Shaft Torque (Nm)

&

If Acceptable Angle of Twist (Deg.) for shaft length < Rated Angle of Twist for Drive Shaft (Deg.)
Then drive shaft diameter selected is acceptable.

Shaft Check Drive Shaft Critical Speed

For the unsupported shaft length calculate the drive shaft critical speed for the support conditions required.

If Shaft Speed (rpm) < Drive Shaft Critical Speed (rpm) then drive shaft selection and configuration is acceptable.

Plummer Block Selection

If the drive shaft selected is not suitable due to the critical speed reduce the unsupported drive shaft length using plummer blocks. e.g. one plummer block at each end of the drive shaft and one in the middle, reducing the unsupported length to half the total drive shaft length.

Select a plummer block from the table relating to the appropriate shaft diameter size.

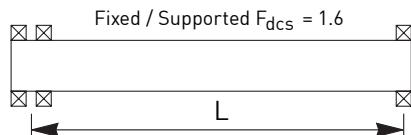

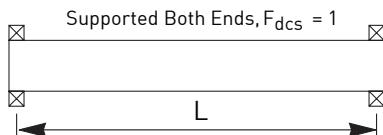

Re-calculate the critical speed for the new unsupported length and check for acceptability.

If space constraints restrict the number of plummer blocks and the drive shaft fails on the critical speed try increasing the shaft diameter to the next size up or consult Power Jacks for detailed analysis.

Note

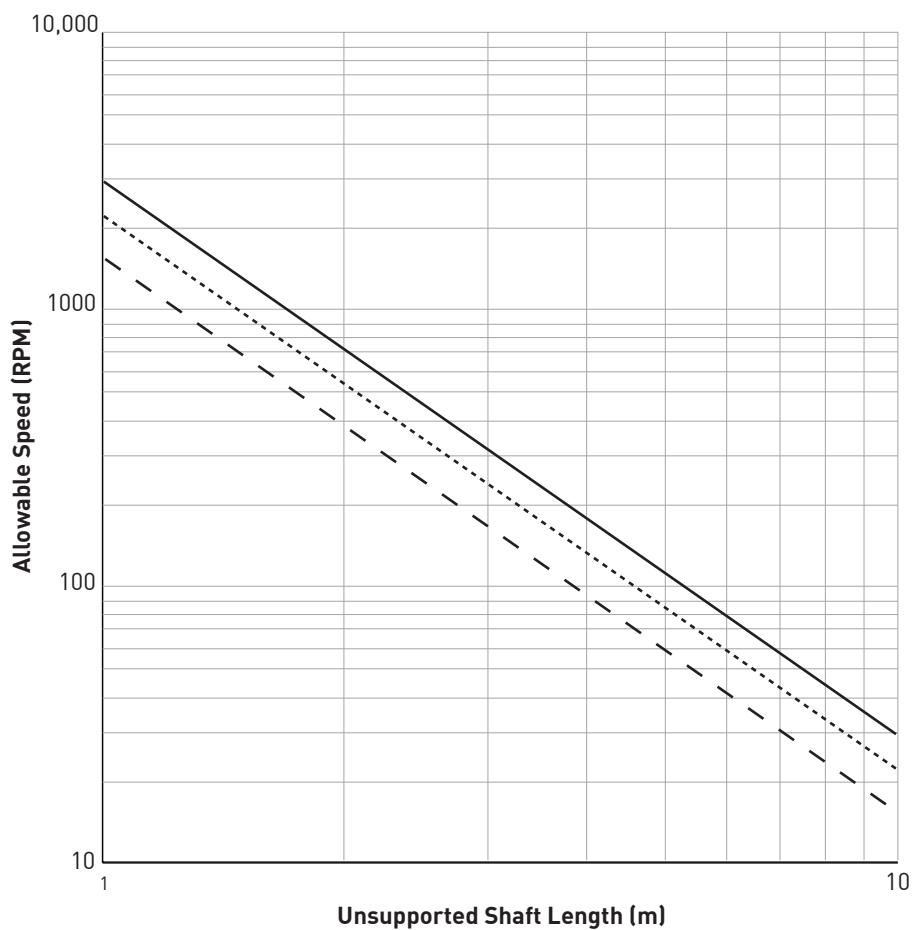

1. For other shaft and plummer block sizes and styles consult Power Jacks Ltd.
2. For detailed shaft analysis and selection consult Power Jacks Ltd.

Solid Drive Shafts

Drive Shaft Critical Speed Factors, F_{dcs} 

$$\text{Allowable Drive Shaft Speed (rpm)} = \frac{\text{Critical Speed (rpm) for}}{\text{Unsupported Length "L" (from chart below)}} \times F_{dcs}$$

**Drive Shaft Critical Speed Graph
(Shaft Whirling)**

Based on simply supported both ends and 70% of the critical speed.
(The factor of safety allows for couplings and slight misalignment)

— 20mm Diameter - - - 30 mm Diameter — 40 mm Diameter

2. Bore diameter tolerances: $(H6+H7)/2$.
3. Material: Cast Iron housing with eccentric locking ring.
4. Dimensions are subject to change without notice.
5. For other styles and sizes of Plummer Blocks consult Power Jacks Ltd.

Split Housing Plummer Block

Plummer blocks are to DIN736 with anti-friction bearings with tapered bores and adapter sleeve. The housings are made of cast iron and are sealed with felt strips on both sides. The housings are designed to allow floating or located bearings (bearing position set with one or two locating rings). It is recommended when arranging drive systems only one plummer block with located bearing is used in one drive line, to avoid distortion of the drive.

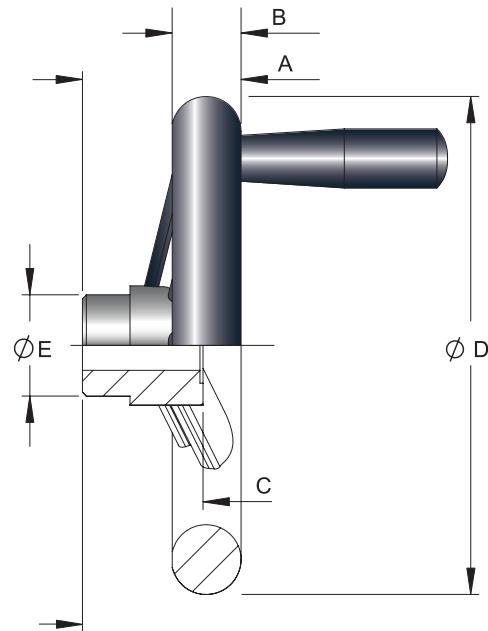

Model	$\emptyset D$	A	B	C	E	F	H	L	M	N	P	Weight (kg)

2. Bored and keyed to BS4235 Part 1
3. All dimensions in millimetres unless otherwise stated
4. Other types of hand wheels are available on request. Consult Power Jacks.

OUR RANGE OF MOTION CONTROL DEVICES ALLOWS YOU TO SAFEGUARD THE OPERATION OF YOUR SCEW JACK SYSTEM AND ENSURES IT OPERATES WITHIN THE SPECIFIED PARAMETERS

RLS-51 Geared Cam Limit Switches

Rotary CAM Limit Switches allow a set of limit switches to be fitted to translating or rotating screw jacks by mounting them directly to the screw jacks worm shaft or indirectly via connecting shafts or gearboxes linking to the screw jacks worm shaft. These limit switches are fully adjustable for position over the entire length of the screw jacks stroke. RLS-51 limit switch features include:-

- Usable revolutions from 4.1 to 16,000
- 2 to 8 position limit switch units
- Enclosure IP66 as standard
- Mounting options for B5 Flange, B14 Face and B3 Foot mounted
- Available in three voltages 250V AC, 24V DC & 80V DC
- Modular design to allow a variety of options
- Operating Temperature: -40°C to +80°C

Illustrated Examples

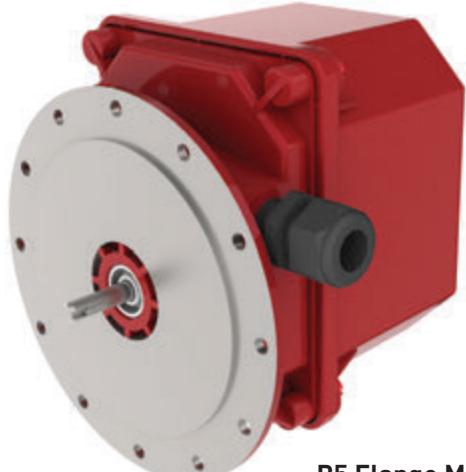

All units shown are of the 2 limit switch type.

B3 Foot Mount

B5 Flange Mount

RLS-51 Features

The RLS-51 geared cam limit switches are universal mechanical switching devices that have been designed for use in conjunction with cam discs based on a specific angle of rotation for indication of a large number of shaft revolutions. These cam discs serve to operate mechanical contacts.

Design features include:-

Low friction planetary gearing with irreversible, self-locking worm adjustment of the cam discs.

Fixed cam adjustment in the housing. The adjusting worms of the cam discs are arranged so that they can be accessed from the same direction as the contact connections for optimal accessibility in confined conditions. Adjustment is possible during operation. The simplicity and accuracy of the cam adjustment is unsurpassed.

Block adjustment of all switching contacts jointly is made possible by a single adjusting worm (black) without the switching points of the individual switching contacts being altered with respect to each other.

Large cam disc diameter for good adjustability and high switching point repeat accuracy.

Reinforced polycarbonate housing as standard with IP66 protection and a wide operating temperature range.

Modular design allows adaptation to suit individual requirements via intermediate pieces.

Options

- Position indicating plate for block adjustment.
- Potentiometer feedback drives (2 available) to suit single and multi-turn potentiometers
- Pulse transmitter with 50 pulses per revolution.
- Anti-condensation heater to prevent condensation and excessively low temperatures in the switches.
- Motor driven contact block adjuster.
- Mounting for encoders (incremental or absolute).
- Extended drive shaft for feedback devices.
- Aluminium housing for harsh environments and the fitment of large and heavy encoders, IP65 enclosure.
- Cam discs with a 40° cam angle can be provided at no extra cost. Other angles can be manufactured at extra cost on request.
- Stage technology tested unit can be provided to V8G 70 with test certificates.

***Caution!** Due to the slow actuation speed of the switching contacts caused by the high gear reductions, the change-over behaviour of the contacts is affected negatively. From gear size 6 it is therefore recommended to use only the normally - closed contacts of the switches. Before using analog feedback systems (eg. potentiometer) please consult our technical department.

Note: Maximum permissible relative humidity 60%

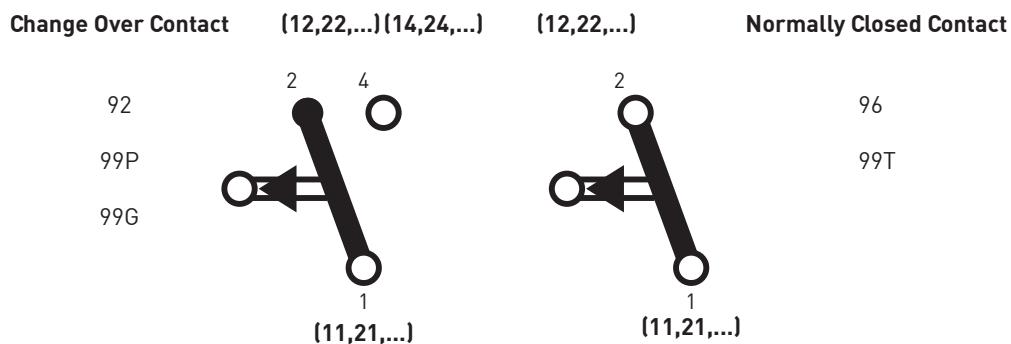

RLS-51 Switching Contacts

The contacts can either be connected through screw terminals for a cable cross section of 0.75mm² to 1.5mm² or through flat plugs 6.3 x 0.8mm or through a printed card with cage tension spring terminals for a cross section of 0.14 to 2.5mm². For contacts with flat - plug connection, insulated flat - plug receptables must be used at voltages above 25V AC and 60V DC.

Proximity Sensors

- Inductive Proximity Sensors.
- Non-contact, so no wearing parts.
- 2 Wire sensor for either Normally Closed (NC) or Normally Open (NO) switching.
- Long sensing range.
- Rugged one-piece Metal housing.
- Optical setting aid with 2 LED colour settings:- Red LED indicates just in sensing range. Yellow LED only indicates within 80% safe sensing range.
- M12 Plug in connection for fast change-ability.
- M12 sockets available straight or angled with 5 m cable.
- Full 360° visibility for switching with 4 yellow LED's at 90° offset.
- Flush face as standard, non-flush available.
- Housing plated brass, Stainless Steel available on request.
- Operating voltage 10 to 30 VDC.
- Enclosure IP67.
- Operating temperature -25°C to +70°C
- Other types available on request. Consult power Jacks.
- Ideal for screw jack end of travel limit switches.

Safety Related Electro-Mechanical Contact Limit Switches

Safety Related Contact Limit Switch Overview

- Positive break Normally Closed contacts - will not stick or weld shut.
- Watertight design to IP67 washdown requirements.
- Rugged corrosion resistant housing tolerants hostile environments.
- Safety system approved.
- Thermoplastic enclosure. Double insulated.
- Snap action with positive-break Normally Closed contact, approved for use in safety systems.
- Alternative actuators heads are available on request. Consult Power Jacks.
- Actuator heads can be repositioned in steps 4 x 90°
- Good resistance to oil and petroleum spirit.
- Actuating force: Min. 9 N.
- Positive break force: 19 N.
- Actuating speed with actuating angle 30° to switch axis. Snap action: Min. 20 mm/min, max. 1 m/s.
- Cable entry: Long Body - 1 cable entry, at end. Short Body - 2 cable entries from sides.
- Ideal for screw jack end of travel limit switches.

Safety Related Contact Limit Switch Specification

Feature	Description
Standards	IEC/EN 60947-5-1; EN 1088; BG-GS-ET-15
Design	EN 50047
Enclosure material	Glass-fibre reinforced thermoplastic, self-extinguishing
Protection class	IP 67 to IEC/EN 60529/DIN VDE 0470-1
Contact material	Silver
Contact type	Change-over with double break Zb, NC contacts with positive break
Switching system	A IEC 60947-5-1; B BG-GS-ET-15; snap action, NC contacts with positive break
Termination	Screw terminals for max. 2.5 mm ² cables (including conductor ferrules)
Rated impulse withstand voltage U imp	6 kV
Rated insulation voltage U i	500 V
Thermal test current I th	10 A
Utilisation category	AC-15; DC-13
Rated operating current/voltage Ie/Ue	4 A/230 VAC; 2.5 A/400 VAC; 1 A/500 VAC; 1 A/24 VDC
Max. fuse rating	10 A (slow blow); 16 A (quick blow), 6 A (slow blow) as positive break position switch
Ambient temperature	-30 °C to +80 °C
Mechanical life	20 million operations
Switching frequency	Max. 5,000/h
Switching point accuracy	-
Actuating speed **	Min. 10 mm/min
Contact break for complete stroke	2 x 2 mm
Bounce duration	< 3 ms
Switchover time	> 5.5 ms

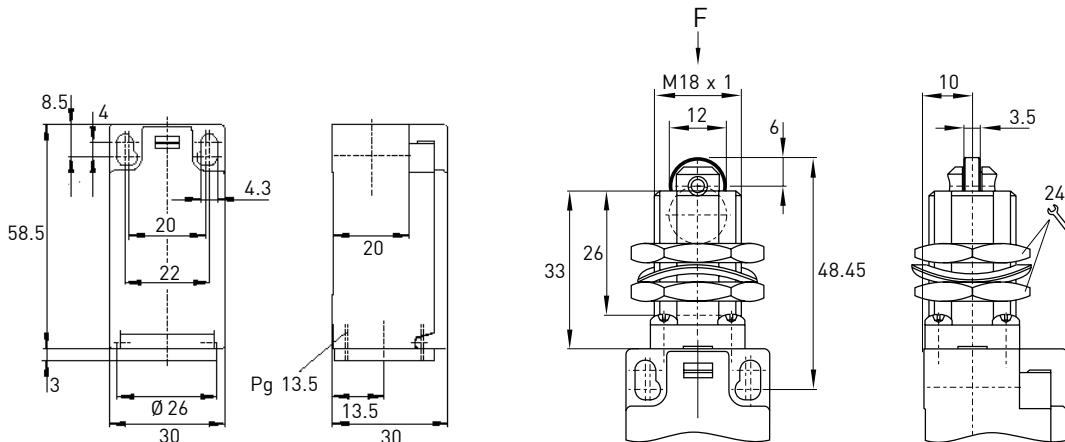

** For the switch plunger.

Incremental Encoders

The DFS60 is a high-resolution incremental encoder in a 60 mm design. The encoder is ideally suited for industrial applications including those with harsh environments due to its high enclosure rating, the large temperature range and robust ball bearing mounts.

- Compact Ø 60 mm design
- High-resolution incremental encoder up to 16 bit
- Programming of output voltage level by customer, zero pulse position, zero pulse width and number of lines from 1 to 65536
- Programming using programming tool or machine controller (RS485)
- Plug-in cable output, radial or axial.
- M23 and M12 connector designs, available axial and radial.
- Designs with face mount or servo flange, blind or through hollow shaft.
- Hollow shaft designs up to Ø15 mm.
- Insulated design available for through hollow shaft.
- Remote zero setting.
- Electrical Interface options include:
 - 4.5 to 5.5 V, TTL/RS422
 - 10 to 32 V, TTL/RS422
 - 10 to 32 V, HTL/push pull
 - 4.5 to 5.5 V, TTL/RS422, with 0-set function on the M23 connector
 - 10 to 32 V, TTL/RS422, with 0-set function on the M23 connector
 - 10 to 32 V, HTL/push pull, with 0-set function on the M23 connector
 - 4.5 to 32 V, TTL/HTL programmable
 - 4.5 to 32 V, TTL/HTL programmable with 0-set function on the M23 connector
- Ambient Temperature Range:
 - Working Temperature – Standard: 0 to +85°C, Optional -30°C to +100°C
 - Working Temperature – Standard: -40°C to +100°C
- Enclosure Rating: IP65 on Shaft and IP67 on housing & connector.
- Standard Shaft Sizes:
 - Blind hollow shaft sizes = 6, 8, 10, 12, 14, 15mm
 - Through hollow shaft sizes = 6, 8, 10, 12, 14, 15mm
 - Solid shaft with flange mount = Ø10 mm
 - Solid shaft with servo flange mount = Ø6 mm

Dimensions – Hollow Blind Shaft

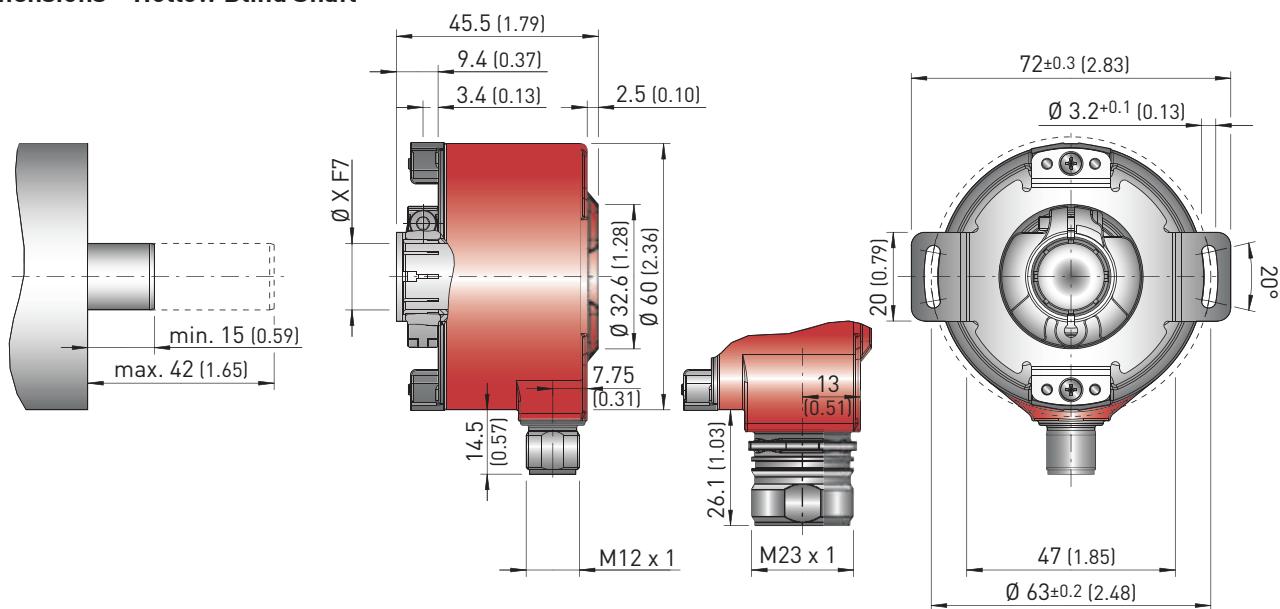

Absolute Encoders

The AFM60 is a high-resolution multi-turn absolute encoder in a 60mm housing design shared with its incremental counterpart. Ideally suited for industrial applications including those with harsh environments due to its high IP enclosure rating, large temperature range and robust ball bearing mounts. The absolute encoders' use the SSI interface as standard but can also be supplied with combined incremental or Sin/Cos interfaces.

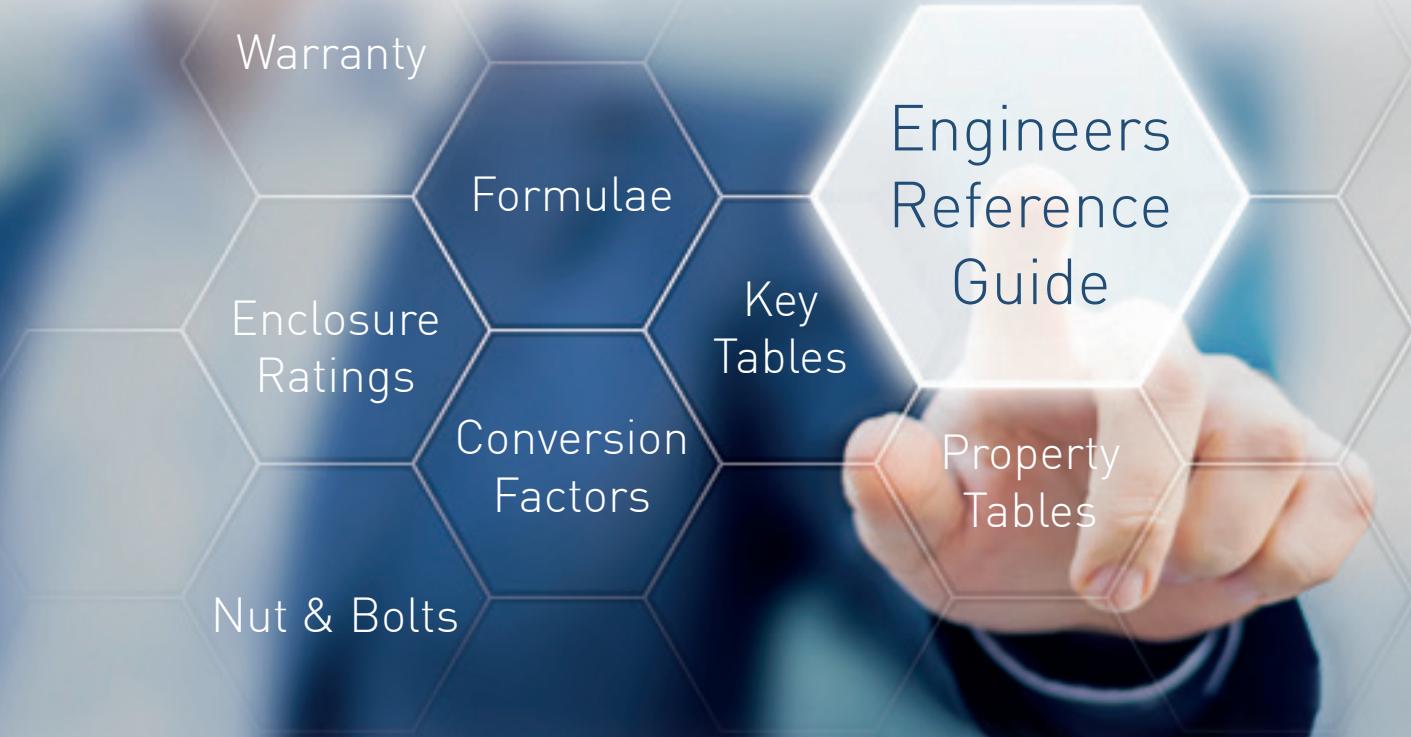

- Compact Ø 60 mm design
- High-resolution absolute encoder up to 30 bit
- Up to 262144 steps per revolution
- Up to 4096 revolutions
- SSI / Gray code.
- Programmable resolution and offset (depends on type).
- Programming using programming tool or machine controller.
- Matched programming cable adapter for M12 & M23 connector available.
- Plug-in cable output, radial or axial.
- M23 and M12 connector designs, available axial and radial.
- Designs with face mount or servo flange, blind or through hollow shaft.
- Hollow shaft designs up to Ø15 mm.
- Operating Voltage 4.5 to 32 V
- Ambient Temperature Range:
 - Working Temperature – Standard: 0 to +85°C, Optional -30°C to +100°C
 - Working Temperature – Standard: -40°C to +100°C
- Enclosure Rating: IP65 on Shaft and IP67 on housing & connector.
- Standard Shaft Sizes:
 - Blind hollow shaft sizes = 8, 10, 12, 14, 15mm
 - Through hollow shaft sizes = 8, 10, 12, 14, 15mm
 - Solid shaft with flange mount = Ø10 mm
 - Solid shaft with servo flange mount = Ø6 mm

Dimensions – Hollow Blind Shaft

1st Digit : Solid Ingress		2nd Digit : Liquid Ingress	
0	No special protection	0	No special protection
1	A large surface of the body, such as hand (but no protection against deliberate access.) Solid objects >50 mm diameter.	1	Dripping water (vertically falling drops).
2	Fingers or similar objects not exceeding 80mm in length. Solid objects >12mm in diameter.	2	Vertically dripping water when the enclosure is tilted at any angle up to 15° from its normal position.
3	Tools, wires, etc. of diameter or thickness >2.5mm. Solid objects >1mm diameter.	3	Water falling as a spray at an angle of 60° from the vertical.
4	Wires or strips of thickness >1mm. Solid objects >1mm diameter.	4	Water splashed against the enclosure from any direction.
5	Ingress of dust is not totally prevented, but dust does not enter in sufficient quantity to interfere with satisfactory operation of the equipment.	5	Water projected by a nozzle against the enclosure.
6	No ingress of dust.	6	Water from heavy seas or projected in powerful jets.
		7	Ingress of water in a harmful quantity not possible when the enclosure is immersed under defined conditions of pressure and time.
		8	Submersible under defined conditions of pressure and time.

NEMA and IEC Equivalent Enclosures

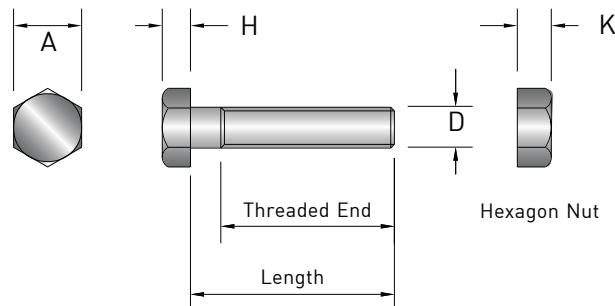

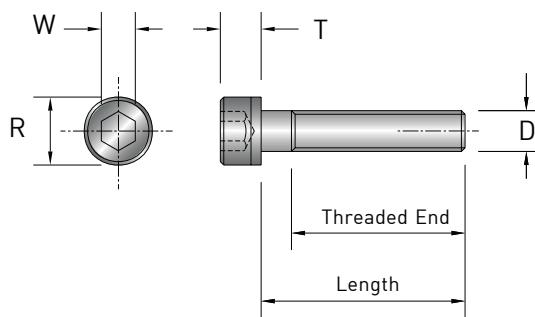

Since the IEC degree of protection for enclosed equipment is defined differently from NEMA type enclosure protection, and methods of test are different, exact correlation between IEC IP-type designations and NEMA types is not possible. It is possible to make rough comparisons, which may result in certain applications. The common NEMA type designations compare with IEC designations as follows:

NEMA Type		Nearest IEC Equivalent	
NEMA 1	General protection of people from live parts. Protection against falling dirt. Test: 1/8" to 1/2" (3.175 to 12.7mm) rod entry test and rust resistance tests.	IP2X (1)	Protected against solid objects greater than 12mm. Test: Metallic test finger and 12mm sphere tests. No IEC rust resistance test.
NEMA 3	Dust-tight and sleet resistant. Test: Rain, dust, external icing and rust resistance test.	IP54	Dust protected. Protected against splashing water. Test: Dust and oscillating sprinkler tests. No IEC rust resistance test.
NEMA 3R	Rain-proof and sleet resistant. Test: Rod entry 1/8" to 1/4" (3.175 to 6.35mm), rain, external icing and rust resistance tests.	IP34	Protected against solid objects greater than 2.5mm. Protected against splashing water. Test: 2.5mm rod and oscillating sprinkler tests. No IEC rust resistance or icing tests.
NEMA 4	Water-tight and dust-tight. Test: Hosedown, rust-resistance and external icing tests.	IP65	Dust-tight and protected against water jets. Test: Dust and spray nozzle tests. no rust resistance or external icing test.
NEMA 4X	Water-tight, dust-tight and corrosion resistance. Test: Hosedown, corrosion resistance and external icing tests.	IPW65 (2)	Dust-tight and protected against water jets. Test: Dust and spray nozzle tests. No rust resistance or external icing test.
NEMA 7	Hazardous gas.	-	No IEC equivalent.
NEMA 9	Hardous dust.	-	No IEC equivalent.
NEMA 12	Dust-tight and drip-tight. Test: Drip, dust and rust resistance tests.	IP61	Dust-tight and protected against dripping water. Test: Dust and rain simulator tests. No IEC rust resistance test.
NEMA 18	Oil tight and dust tight. Test: Oil-tightness and rust-resistance tests.	IP6X (1)	Dust-tight. Test: Dust test. No IEC oil-tightness or rust resistance tests.

Note

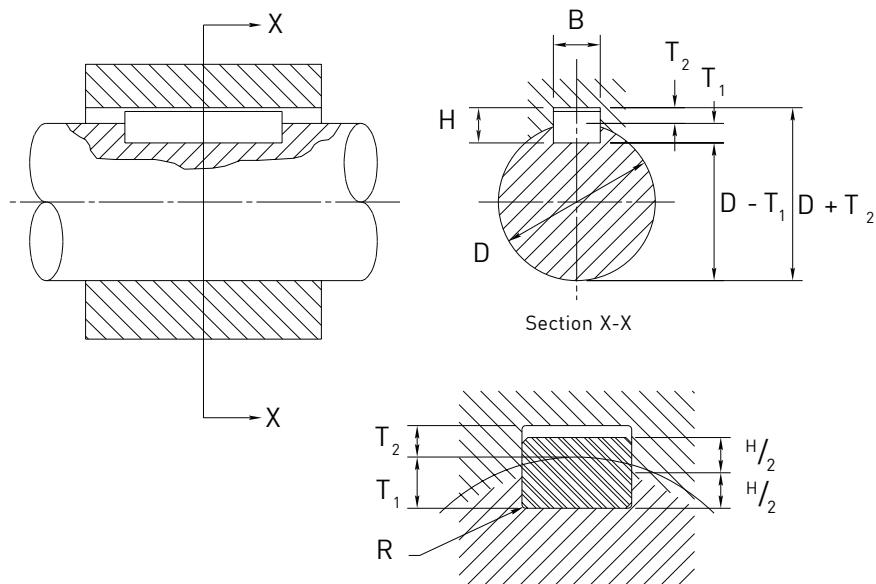

- When only one characteristic numeral is used the second numeral is replaced by an 'X'.
- 'W' inserted after the 'IP' indicates suitable for a specified weather condition (conditions and features specified by manufacturer).

hecto ‡	h	100 = 10^2
deca ‡	da	10 = 10^1
deci ‡	d	0.1 = 10^{-1}
centi ‡	c	0.01 = 10^{-2}
milli	m	0.001 = 10^{-3}
micro	μ	0.000 001 = 10^{-6}
nano	n	0.000 000 001 = 10^{-9}
pico	p	0.000 000 000 001 = 10^{-12}
femto	f	0.000 000 000 000 001 = 10^{-15}
atto	a	0.000 000 000 000 000 001 = 10^{-18}

* If possible use multiple and submultiple prefixes in steps of 1000.

† Spaces are used in SI instead of commas to group numbers to avoid confusion with the practise in some European countries of using commas for decimal points.

‡ Not recommended but sometimes encountered.

Limitation of Responsibility

The ratings given in this catalogue were compiled using standard engineering procedures. The ratings are designed to guide the customer in the selection of a unit. We do not guarantee the ratings in specific applications. Prototype testing of every application is recommended before production. Our engineering facilities are available for consultation at all times. Please ask us for assistance with linear motion and drive application problems. This catalogue is designed to assist in the selection of a suitable linear motion or power transmission product for economical, long and trouble free service.

Due to Power Jacks policy of continuous improvement designs may be subject to change without notice. Please ask for certified drawings.

Warranty Definitions

When used in these conditions the following words have the meanings set out opposite them below:

Company:	Power Jacks Limited
Contract:	The contract between the Company and the Customer for the supply of the Goods.
Customer:	The party to whom the Goods are to be supplied under the Contract
Goods:	The goods to be provided under the Contract
Writing:	Includes facsimile or electronic transmission and comparable means of communication

Warranty Definitions

The Company warrants that any Goods sold by it under Power Jacks standard terms and conditions of sale will be free from defects caused by faulty materials or poor workmanship but gives no warranty and makes no representation whatsoever express or implied as to any other matters including without limitation condition merchantability or fitness for any purpose.

The Company shall incur no liability under this warranty unless:

- The Company is promptly notified in Writing upon discovery of any such defects by the Customer and the Customer forthwith ceases to use the defective Goods unless otherwise authorised by the Company; and
- The defective item is immediately returned to the Company, transportation charges being prepaid by the Customer or the Company is, at its option, given the opportunity to remedy any defect.

The Company's warranty as specified above is limited to a period of 12 months from the date of delivery (ex-works Power Jacks) and its liability shall be limited to replacing, repairing or issuing credit at its option for any Goods returned by the Customer within the aforesaid period.

The Company shall not be liable for consequential loss or damage by reason of any defect in (or failure to comply with any written estimate of performance of) Goods supplied by the Company whether original or substituted.

The Customer will indemnify the Company against all third party claims made in respect of the Goods.

POWERJACKS

PRECISION ACTUATION

Power Jacks specialises in the design and manufacture of precision linear actuation, positioning and lifting equipment.

Our products are supplied globally across many sectors including Industrial Automation, Energy, Transport, Defence and Civil.
